## Scoring Guidelines

### AP<sup>®</sup> COMPUTER SCIENCE A 2018 SCORING GUIDELINES

Apply the question assessment rubric first, which always takes precedence. Penalty points can only be deducted in a part of the question that has earned credit via the question rubric. No part of a question (a, b, c) may have a negative point total. A given penalty can be assessed only once for a question, even if it occurs multiple times or in multiple parts of that question. A maximum of 3 penalty points may be assessed per question.

#### 1-Point Penalty

- v) Array/collection access confusion (`[] get`)
- w) Extraneous code that causes side-effect (e.g., printing to output, incorrect precondition check)
- x) Local variables used but none declared
- y) Destruction of persistent data (e.g., changing value referenced by parameter)
- z) Void method or constructor that returns a value

#### No Penalty

- o Extraneous code with no side-effect (e.g., valid precondition check, no-op)
- o Spelling/case discrepancies where there is no ambiguity\*
- o Local variable not declared provided other variables are declared in some part
- o `private` or `public` qualifier on a local variable
- o Missing `public` qualifier on class or constructor header
- o Keyword used as an identifier
- o Common mathematical symbols used for operators (`*` `*` `÷` `≤` `≥` `<>` `≠`)
- o `[]` vs. `()` vs. `<>`
- o `=` instead of `==` and vice versa
- o `length/size` confusion for array, String, List, or ArrayList; with or without `()`
- o Extraneous `[]` when referencing entire array
- o `[i, j]` instead of `[i][j]`
- o Extraneous size in array declaration, e.g., `int[size] nums = new int[size];`
- o Missing `;` where structure clearly conveys intent
- o Missing `{ }` where indentation clearly conveys intent
- o Missing `()` on parameter-less method or constructor invocations
- o Missing `()` around `if` or `while` conditions

*\*Spelling and case discrepancies for identifiers fall under the “No Penalty” category only if the correction can be **unambiguously** inferred from context, for example, “ArrayList” instead of “ArrayList”. As a counterexample, note that if the code declares “`int G=99, g=0;`”, then uses “`while (G < 10)`” instead of “`while (g < 10)`”, the context does **not** allow for the reader to assume the use of the lower case variable.*

2018 SCORING GUIDELINES**

**Question 1: Frog Simulation**

|                 |                       |                 |
|-----------------|-----------------------|-----------------|
| <b>Part (a)</b> | <code>simulate</code> | <b>5 points</b> |
|-----------------|-----------------------|-----------------|

**Intent:** *Simulate the distance traveled by a hopping frog*

- +1** Calls `hopDistance` and uses returned distance to adjust (or represent) the frog's position
- +1** Initializes and accumulates the frog's position at most `maxHops` times (*must be in context of a loop*)
- +1** Determines if a distance representing multiple hops is at least `goalDistance`
- +1** Determines if a distance representing multiple hops is less than starting position
- +1** Returns `true` if goal ever reached, `false` if goal never reached or position ever less than starting position

|                 |                             |                 |
|-----------------|-----------------------------|-----------------|
| <b>Part (b)</b> | <code>runSimulations</code> | <b>4 points</b> |
|-----------------|-----------------------------|-----------------|

**Intent:** *Determine the proportion of successful frog hopping simulations*

- +1** Calls `simulate` the specified number of times (*no bounds errors*)
- +1** Initializes and accumulates a count of `true` results
- +1** Calculates proportion of successful simulations using `double` arithmetic
- +1** Returns calculated value

**AP<sup>®</sup> COMPUTER SCIENCE A  
2018 SCORING GUIDELINES**

**Question 1: Scoring Notes**

| <b>Part (a)</b> <code>simulate</code>       |                                                                                                                                       | <b>5 points</b>                                                                                                                                                             |                                                                                                                                                                                                               |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Points                                      | Rubric Criteria                                                                                                                       | Responses earn the point if they...                                                                                                                                         | Responses will not earn the point if they...                                                                                                                                                                  |
| +1                                          | Calls <code>hopDistance</code> and uses returned distance to adjust (or represent) the frog's position                                | <ul style="list-style-type: none"> <li>use <code>hopDistance()</code> as a position, like <code>hopDistance() &lt; 0</code></li> </ul>                                      | <ul style="list-style-type: none"> <li>only use <code>hopDistance()</code> as a count, like <code>hopDistance() &lt; maxHops</code></li> </ul>                                                                |
| +1                                          | Initializes and accumulates the frog's position at most <code>maxHops</code> times ( <i>must be in context of a loop</i> )            |                                                                                                                                                                             | <ul style="list-style-type: none"> <li>do not use a loop</li> </ul>                                                                                                                                           |

**Question 1: Frog Simulation**

*Part (a)*

```
public boolean simulate()
{
    int position = 0;

    for (int count = 0; count < maxHops; count++)
    {
        position += hopDistance();
        if (position >= goalDistance)
        {
            return true;
        }
        else if (position < 0)
        {
            return false;
        }
    }
    return false;
}
```

*Part (b)*

```
public double runSimulations(int num)
{
    int countSuccess = 0;

    for (int count = 0; count < num; count++)
    {
        if(simulate())
        {
            countSuccess++;
        }
    }
    return (double)countSuccess / num;
}
```

These canonical solutions serve an expository role, depicting general approaches to solution. Each reflects only one instance from the infinite set of valid solutions. The solutions are presented in a coding style chosen to enhance readability and facilitate understanding.

**Question 2: Word Pair**

|                 |              |                 |
|-----------------|--------------|-----------------|
| <b>Part (a)</b> | WordPairList | <b>5 points</b> |
|-----------------|--------------|-----------------|

**Intent:** *Form pairs of strings from an array and add to an ArrayList*

- +1** Creates new ArrayList and assigns to allPairs
- +1** Accesses all elements of words (*no bounds errors*)
- +1** Constructs new WordPair using distinct elements of words
- +1** Adds all necessary pairs of elements from word array to allPairs
- +1** **On exit:** allPairs contains all necessary pairs and no unnecessary pairs

|                 |            |                 |
|-----------------|------------|-----------------|
| <b>Part (b)</b> | numMatches | <b>4 points</b> |
|-----------------|------------|-----------------|

**Intent:** *Count the number of pairs in an ArrayList that have the same value*

- +1** Accesses all elements in allPairs (*no bounds errors*)
- +1** Calls getFirst or getSecond on an element from list of pairs
- +1** Compares first and second components of a pair in the list
- +1** Counts number of matches of pair-like values

|                                    |
|------------------------------------|
| <b>Question-Specific Penalties</b> |
|------------------------------------|

- 1** (z) Constructor returns a value

**Question 2: Word Pair**

*Part (a)*

```
public WordPairList(String[] words)
{
    allPairs = new ArrayList<WordPair>();

    for (int i = 0; i < words.length-1; i++)
    {
        for (int j = i+1; j < words.length; j++)
        {
            allPairs.add(new WordPair(words[i], words[j]));
        }
    }
}
```

*Part (b)*

```
public int numMatches()
{
    int count = 0;

    for (WordPair pair: allPairs)
    {
        if (pair.getFirst().equals(pair.getSecond()))
        {
            count++;
        }
    }

    return count;
}
```

These canonical solutions serve an expository role, depicting general approaches to solution. Each reflects only one instance from the infinite set of valid solutions. The solutions are presented in a coding style chosen to enhance readability and facilitate understanding.

**Question 3: Code Word Checker**

|                                            |                 |
|--------------------------------------------|-----------------|
| <b>Class:</b> <code>CodeWordChecker</code> | <b>9 points</b> |
|--------------------------------------------|-----------------|

**Intent:** Define implementation of a class to determine if a string meets a set of criteria

- +1** Declares header: `public class CodeWordChecker implements StringChecker`
- +1** Declares all appropriate `private` instance variables
- +3** Constructors
  - +1** Declares headers: `public CodeWordChecker(int __, int __, String __)` and `public CodeWordChecker(String __)`
  - +1** Uses all parameters to initialize instance variables in 3-parameter constructor
  - +1** Uses parameter and default values to initialize instance variables in 1-parameter constructor
- +4** `isValid` method
  - +1** Declares header: `public boolean isValid(String __)`
  - +1** Checks for length between min and max inclusive
  - +1** Checks for unwanted string
  - +1** Returns `true` if length is between min and max and does not contain the unwanted string, `false` otherwise

**Question 3: Code Word Checker**

```
public class CodeWordChecker implements StringChecker
{
    private int minLength;
    private int maxLength;
    private String notAllowed;

    public CodeWordChecker(int minLen, int maxLen, String symbol)
    {
        minLength = minLen;
        maxLength = maxLen;
        notAllowed = symbol;
    }

    public CodeWordChecker(String symbol)
    {
        minLength = 6;
        maxLength = 20;
        notAllowed = symbol;
    }

    public boolean isValid(String str)
    {
        return str.length() >= minLength && str.length() <= maxLength &&
            str.indexOf(notAllowed) == -1;
    }
}
```

These canonical solutions serve an expository role, depicting general approaches to solution. Each reflects only one instance from the infinite set of valid solutions. The solutions are presented in a coding style chosen to enhance readability and facilitate understanding.

**Question 4: Latin Squares**

|                 |                        |                 |
|-----------------|------------------------|-----------------|
| <b>Part (a)</b> | <code>getColumn</code> | <b>4 points</b> |
|-----------------|------------------------|-----------------|

**Intent:** Create a 1-D array that contains the values from one column of a 2-D array

- +1 Constructs a new `int` array of size `arr2D.length`
- +1 Accesses all items in one column of `arr2D` (*no bounds errors*)
- +1 Assigns one element from `arr2D` to the corresponding element in the new array
- +1 **On exit:** The new array has all the elements from the specified column in `arr2D` in the correct order

|                 |                      |                 |
|-----------------|----------------------|-----------------|
| <b>Part (b)</b> | <code>isLatin</code> | <b>5 points</b> |
|-----------------|----------------------|-----------------|

**Intent:** Check conditions to determine if a square 2-D array is a Latin square

- +1 Calls `containsDuplicates` referencing a row or column of `square`
- +1 Calls `hasAllValues` referencing two different rows, two different columns, or one row and one column
- +1 Applies `hasAllValues` to all rows or all columns (*no bounds errors*)
- +1 Calls `getColumn` to obtain a valid column from `square`
- +1 Returns `true` if all three Latin square conditions are satisfied, `false` otherwise

|                                    |
|------------------------------------|
| <b>Question-Specific Penalties</b> |
|------------------------------------|

- 1 (r) incorrect construction of a copy of a row
- 1 (s) syntactically incorrect method call to any of `getColumn()`, `containsDuplicates()`, or `hasAllValues()`

**Question 4: Latin Squares**

*Part (a)*

```
public static int[] getColumn(int[][] arr2D, int c)
{
    int[] result = new int[arr2D.length];

    for (int r = 0; r < arr2D.length; r++)
    {
        result[r] = arr2D[r][c];
    }
    return result;
}
```

*Part (b)*

```
public static boolean isLatin(int[][] square)
{
    if (containsDuplicates(square[0]))
    {
        return false;
    }

    for (int r = 1; r < square.length; r++)
    {
        if (!hasAllValues(square[0], square[r]))
        {
            return false;
        }
    }

    for (int c = 0; c < square[0].length; c++)
    {
        if (!hasAllValues(square[0], getColumn(square, c)))
        {
            return false;
        }
    }

    return true;
}
```

These canonical solutions serve an expository role, depicting general approaches to solution. Each reflects only one instance from the infinite set of valid solutions. The solutions are presented in a coding style chosen to enhance readability and facilitate understanding.
