

9.3 Chemical periodicity of other elements

Name: _____ Class: _____ Date: _____ Total: 9 marks

KEY WORDS periodicity 周期性 • oxide 氧化物 • period 周期 • giant metallic 金属晶体
• melting point 熔点

Objective

Build the skills to answer exam questions on the **chemical periodicity of other elements** — using periodic trends to **predict** properties from position and **deduce** an unknown element's identity.

You must be able to:

- predict the characteristic properties of an element from its group
- deduce the likely position and identity of an unknown element from its properties

1 Worked examples

■ Predicting from position

Na ₂ O	MgO	Al ₂ O ₃	P ₄ O ₁₀	SO ₃
basic		amphoteric	acidic	
pH ≈ 14		pH ≈ 7		pH ≈ 0

metal oxides (left) are basic; non-metal oxides (right) are acidic

Knowing how properties vary across a period and down a group lets you predict or deduce an element

Period 3 chlorides react differently with water

Use the patterns you know:

- **down a group** — properties change steadily (e.g. Group 1: more reactive, larger atoms going down).
- **across a period** — metal → non-metal; oxides basic → acidic; bonding ionic → covalent.

Predict: a Group 1 element forms a +1 ion, is a reactive metal, and has a basic oxide. **Deduce:** an element with a basic oxide, high conductivity and a +2 ion is a Group 2 metal.

2 Practice

2.1 Predict the charge of the ion formed by an element in Group 2. [1]

2.2 State whether the oxide of a Group 1 element is acidic or basic. [1]

3 Exam-style questions

3.1 An element X has a giant metallic structure, conducts electricity, and forms a basic oxide of formula XO. X is most likely in: [1]

- A Group 1
- B Group 2
- C Group 16
- D Group 17

3.2 Going **down** Group 17 (the halogens), the elements become:

[1]

- **A** less reactive
 - **B** more reactive
 - **C** more metallic in their oxides
 - **D** smaller atoms
-

3.3 An unknown element Y forms a chloride that fumes in moist air and gives an acidic solution with water; Y's oxide is acidic.

(a) Deduce whether Y is a metal or a non-metal, and explain.

[2]

(b) Suggest the region of the Periodic Table where Y is found.

[1]

3.4 Using periodic trends, predict **two** properties of caesium (Cs), in Group 1 below sodium.

[2]

Solutions

2.1 2+.

2.2 basic.

3.1 B. A basic oxide XO (+2) and metallic conductivity point to Group 2.

3.2 A. Reactivity decreases down Group 17.

3.3 (a) a non-metal; its oxide and chloride are acidic/covalent and the chloride hydrolyses — typical of non-metals.

(b) the right-hand side (non-metal region) of the Periodic Table.

3.4 any two: it is a (very) reactive metal; forms a +1 ion; has a basic oxide; reacts vigorously with water; larger atom / lower melting point than sodium.
