

8.1 Rate of reaction

Name: _____ Class: _____ Date: _____

Total: 10 marks

KEY WORDS rate of reaction 反应速率 • collision 碰撞 • effective collision 有效碰撞
 • collision frequency 碰撞频率 • non-effective collision 无效碰撞

Objective

Build the skills to answer exam questions on **rate of reaction** — **collision** 碰撞 theory, **effective collisions** 有效碰撞, and the effect of concentration and pressure.

You must be able to:

- explain rate, collision frequency, and effective vs non-effective collisions
- explain the effect of concentration and pressure on rate
- calculate a rate from experimental data

1 Worked examples

■ Collisions and rate

A collision only reacts with the right orientation and enough energy — an effective collision

The **rate** is the change in concentration (or amount) per unit time. It depends on the **frequency of effective collisions**.

■ Concentration and pressure

More particles in the same volume collide more often, so the rate rises

Increasing concentration (or gas pressure) packs particles closer → more effective collisions per second → faster rate.

2 Practice

2.1 State the **two** things a collision needs to be effective. [2]

2.2 Explain why increasing the concentration of a reactant speeds up a reaction. [2]

3 Exam-style questions

3.1 Increasing the pressure of a gas reaction increases the rate because: [1]

A	B
C	D

- A the particles gain activation energy
- B the particles are closer, so collide more often
- C the activation energy falls
- D the catalyst works better

3.2 A reaction produces 48 cm³ of gas in 20 s. The mean rate of reaction is: [1]

A	B
C	D

- A 0.42 cm³ s⁻¹
- B 2.4 cm³ s⁻¹
- C 24 cm³ s⁻¹
- D 960 cm³ s⁻¹

3.3 A reaction makes carbon dioxide. The volume collected is 30 cm^3 at 15 s and 54 cm^3 at 45 s.

(a) Calculate the mean rate of reaction between 15 s and 45 s. [2]

(b) Explain why the rate is faster at the start of the reaction than near the end. [2]
