

35 Polyesters and polyamides – Part 2

Name: _____ Class: _____ Date: _____

Vocabulary 词汇

Write each word three times. 把每个单词抄写三遍。

English	中文	Write it 3 times (English)
diol	二醇	_____
dicarboxylic acid	二羧酸	_____
diamine	二胺	_____
Amino acids	氨基酸	_____

Recall

You can build a polyester or a polyamide from monomers that each have two reactive groups.

New ideas

Read these first, then do the Practice.

■ 1 Making a polyester

Make a polyester from a **diol** 二醇 (two –OH groups) and a **dicarboxylic acid** 二羧酸 (two –COOH groups). Water is released.

■ 2 Making a polyamide

Make a polyamide from a **diamine** 二胺 (two –NH₂ groups) and a dicarboxylic acid. **Amino acids** 氨基酸 join this way too — proteins are natural polyamides.

Watch out: a *polyester* comes from a diol + a dicarboxylic acid (ester links); a *polyamide* comes from a diamine + a dicarboxylic acid (amide links). Both release water at each link.

Practice

Try these in order.

35.6 What two monomers make a *polyester*? [1]

35.7 How many –OH groups does a *diol* have? [1]

35.8 What two monomers make a *polyamide*? [1]

35.9 What small molecule is released in both? [1]

35.10 Proteins are natural examples of which polymer? [1]

35.11 Challenge. An amino acid has *both* an –NH₂ group and a –COOH group. Explain why this lets amino acids join into a polyamide (a protein). [2]
