

Hydroxy Compounds

A-Level Chemistry ■ Topic 16

A-Level Chemistry

What we will cover

1 Alcohols & three classes

2 Oxidation by class

3 The dichromate test

4 Distillation vs reflux

5 Other reactions

ethanol kills microbes

Alcohols and three classes

primary (1 R)

secondary (2 R)

tertiary (3 R)

distillation

Oxidation by class

With acidified $K_2Cr_2O_7$:

- primary → **aldehyde** 醛 → **carboxylic acid** 羧酸
- secondary → a **ketone** 酮
- tertiary → not oxidised

The dichromate test

warm with acidified $\text{K}_2\text{Cr}_2\text{O}_7$ (orange)

primary or
secondary
orange → green

tertiary
stays orange

Acidified **dichromate** 重铬酸盐
turns orange to green with a primary or secondary alcohol, but stays orange with a tertiary one.

Distillation vs reflux

reflux

vapour returns: fully
oxidised to the acid

distillation

product distils off as
it forms (the aldehyde)

- **distillation** 蒸馏 removes the aldehyde as it forms – stops at the aldehyde
- **reflux** 回流 keeps boiling & returning the vapour – fully oxidises to the acid

Other reactions

combustion 燃烧

dehydration 脱水 → alkene

esterification 酯化

with Na → H₂

substitution → halogenoalkane

Alcohols are very weakly acidic – **less** than water (the alkyl group destabilises RO⁻). The **iodoform test** 碘仿试验 detects the CH₃CH(OH)– group.

Worked example – oxidising an alcohol

Oxidise (a) propan-1-ol and (b) propan-2-ol. How do you stop at the aldehyde?

- (a) Primary → **propanal** (aldehyde) → **propanoic acid**.
- Stop at the aldehyde by **distilling it off as it forms** (its b.p. is lower – no O–H bonding).
- **Reflux** with excess oxidant to go all the way to the acid.
- (b) Secondary → **propanone**, and it stops there.
- Both turn the dichromate **orange** → **green**.

Primary → aldehyde → acid; secondary → ketone; tertiary → **no reaction** (no H on the C–OH carbon).

Topic 16 – key takeaways

1

Classes

primary, secondary, tertiary

2

Oxidation

1° to aldehyde/acid; 2° to ketone; 3° none

3

Dichromate

orange to green for 1° & 2°

4

Apparatus

distillation stops early; reflux goes all the way

Check yourself

- 1 What does a secondary alcohol oxidise to?
- 2 Which class is not oxidised by dichromate?
- 3 Which apparatus fully oxidises to the acid?
- 4 Are alcohols more or less acidic than water?

Answers 1. a ketone 2. tertiary 3. reflux 4. less acidic
