

6.1 Data Security

Name: _____ Class: _____ Date: _____ **Total: 36 marks**

KEY WORDS security 安全 • integrity 完整性 • phishing 网络钓鱼 • data security 数据安全
• privacy 隐私

Objective

Build the skills to answer exam questions on **data security** 数据安全 — the difference between security, privacy and integrity; the threats from networks; and the measures that protect a system.

You must be able to:

- explain the difference between **security**, **privacy** 隐私 and **integrity** 完整性
- describe the **threats** to data and systems posed by networks and the internet
- describe **security measures** for a standalone PC and for a networked system

1 Worked examples

Study these first. Each one shows the method for a question type used later — follow the steps and you can do the Practice and Exam-style questions yourself.

■ Three different ideas

inspects & filters traffic
(allows or blocks each packet)

user's computer

firewall

internet

trusted side

untrusted side

A firewall is a core data-security control at the network edge

Term	Means	Example failure
security	protect data from unauthorised access/change	a hacker reads the file
privacy	a person controls who sees their personal data	data shared without consent
integrity	data stays accurate and complete	a typo corrupts a record

All three are needed — a file can be secure but still have a typo (no integrity), or accurate but readable by anyone (no privacy).

■ Threats from the internet

Threat	What it does
virus / worm	self-copying malware (a worm spreads over the network alone)
Trojan horse	looks useful but hides malicious code
ransomware	encrypts your files and demands payment
spyware	secretly records keystrokes / passwords
phishing	fake emails/sites trick users into giving credentials
pharming 域名欺骗	redirects a user to a fake site even when they type the correct address
denial of service	floods a server so real users can't connect
brute-force attack	tries many passwords until one works

■ Security measures

- **standalone PC**: strong password; up-to-date antivirus; software updates; **backup**; **encryption**; locked screen.
- **networked system**: all of the above **plus** a **firewall** 防火墙; per-user **permissions**, central account management and **audit logs**.

2 Practice

Now apply the methods above.

2.1 State the difference between data **security** and data **privacy**. [2]

2.2 Name the type of malware that **encrypts a user's files and demands payment**. [1]

2.3 State **two** security measures suitable for a standalone PC. [2]

2.4 State what a **firewall** does. [1]

3 Exam-style questions

3.1 Explain the difference between **security**, **privacy** and **integrity**, giving an example of each. [3]

3.2 Describe **two** threats posed by connecting a computer to the internet, and give a measure that reduces each. [4]

3.3 (a) State what **phishing** is. [1]

(b) State one way a user can reduce the risk of falling for a phishing attack. [1]

3.4 Explain how a **firewall** and **user permissions** together help protect a networked system. [3]

3.5 State **one** difference between **phishing** and **pharming**. [2]

3.6 A bank sends confidential statements to its customers over the internet.

(a) **Describe** how the bank uses **asymmetric encryption** so that only the intended customer can read a statement. [3]

(b) The statement also carries a **digital signature**. **Describe** how the signature is created by the bank and checked by the customer, and **state** what it proves. [5]

(c) A **checksum** is sent with the file as well. **Explain** what a checksum detects that a digital signature does not need to, and **state** why a checksum alone would not be enough for security. [3]

(d) A customer's computer is infected by **malware** that records keystrokes. **Name** this type of malware and **describe** two measures that would reduce the risk. [3]

(e) The bank also protects its own network with a **firewall**. **Describe** two things a firewall does. [2]
