

Data Types & Structures

AS Computer Science ■ Topic 10

A-Level Computer Science

What we will cover

- 1 Data types & records
- 2 Arrays
- 3 Files
- 4 Stacks, queues, linked lists
- 5 Implementing with arrays
- 6 Recap

Data types and records

Pick the smallest precise **data type** 数据类型:

- INTEGER, REAL, STRING
- CHAR, BOOLEAN, DATE

A **record** 记录 groups several types under one name (dot notation `Item1.Category`).

record `TStockItem`

<code>ItemID : INTEGER</code>
<code>Category : STRING</code>
<code>ItemCost : REAL</code>
<code>InStock : BOOLEAN</code>

one name holds
four fields of
different types

reach one field: `Item1.Category`

Arrays

		column index			
		$[r, 1]$	$[r, 2]$	$[r, 3]$	$[r, 4]$
row index	$[1, c]$	12	31	17	48
	$[2, c]$	19	67	99	29
	$[3, c]$	42	22	95	61

Grid[2,3]
(row 2, column 3)

2-D: a table, indexed [row, column]

Searching and sorting

5	2	8	1
---	---	---	---

start

2	5	8	1
---	---	---	---

compare 5, 2 → swap

2	5	8	1
---	---	---	---

compare 5, 8 → already in order

2	5	1	8
---	---	---	---

compare 8, 1 → swap (8 reaches the end)

Worked example: find the largest

```
DECLARE Marks : ARRAY[1:4] OF INTEGER
Max ← Marks[1]
FOR i ← 2 TO 4
  IF Marks[i] > Max THEN
    Max ← Marks[i]
  ENDIF
NEXT i
OUTPUT Max
```

[1]	[2]	[3]	[4]
7	3	9	2

i	Marks[i]	Max
—	—	7
2	3	7
3	9	9
4	2	9

output: **9**

Start Max at the **first element**, not at 0 – then compare from the second.

Files

A **file** 文件 keeps data on disk **between runs** (RAM is lost at exit).

- OPENFILE for READ/WRITE/APPEND
- EOF tests the **end of file** 文件结束
- always CLOSEFILE – or buffered writes are lost

Abstract data types: the stack

A **stack** 栈 is **LIFO** 后进先出: push and pop happen at the **top** – undo history, procedure calls.

A stack is
last-in, first-out

Abstract data types: the queue

A queue is first-in, first-out

A **queue** 队列 is **FIFO** 先进先出: enqueue at the back, dequeue at the front – print **spooling** 排队打印, scheduling.

Linked list

insert 19: re-point two arrows

A **linked list** 链表 chains **nodes** 节点, each a value + a **pointer** 指针 to the next.

- + cheap insert/delete – **nothing shifts**
- – slow random access

ADTs with arrays

- stack: a Top index; full = **overflow** 溢出, empty = **underflow** 下溢
- queue: a **circular array** 循环数组 – pointers wrap with $(p \text{ MOD } \text{MaxSize}) + 1$

Linked list in an array

Store nodes in an array of records, each with a Next index. A **free list** 空闲列表 chains the unused slots – linked-structure flexibility with static allocation.

Topic 10 – key takeaways

1

Records & arrays

records mix types; arrays hold one type

2

Files

persist data; open, read/write, close

3

Stack & queue

LIFO vs FIFO

4

Linked list

nodes with pointers; cheap insert/delete

Check yourself

- 1 Which holds several different types together?
- 2 Which ADT is FIFO?
- 3 Why use a circular array for a queue?
- 4 One advantage of a linked list over an array?

Answers 1. a record 2. a queue 3. reuse the wrapped-round cells 4. cheap insertion/deletion
