

4.3 Aggregate Demand and Aggregate Supply analysis

Name: _____ Class: _____ Date: _____ Total: 26 marks

KEY WORDS aggregate demand 总需求 • aggregate supply 总供给
• macroeconomic equilibrium 宏观经济均衡 • equilibrium 均衡 • price level 价格水平

Objective

Build the skills to answer exam questions on **aggregate demand and aggregate supply** 总需求与总供给 (AD-AS) — the components of **AD** 总需求, **SRAS** and **LRAS** 短期/长期总供给, and **macroeconomic equilibrium** 宏观经济均衡.

You must be able to:

- state the components of AD and explain its slope
- distinguish SRAS from LRAS
- draw AD-AS and analyse a shift in equilibrium

1 Worked examples

■ AD-AS equilibrium

short-run equilibrium: $AD = SRAS$ • long-run capacity: vertical $LRAS$

Vertical LRAS marks full capacity 生产能力

$$AD = C + I + G + (X - M)$$

- **C** consumption, **I** investment, **G** government spending, **(X - M)** net exports.
- **SRAS** 短期总供给 slopes up (shifts when costs change); **LRAS** 长期总供给 is vertical at full capacity.
- **Equilibrium** where AD meets AS → sets the **price level** and **real output**.

boom → recession → slump → recovery (around the growth trend)

Shifts in AD or AS move the economy around the business cycle over time

Answer shapes: an **Explain** [up to 8] answer should use a labelled AD-AS diagram (AO3); **Discuss** [12] adds a judgement (AO4).

2 Practice

2.1 State the four components of aggregate demand. [2]

2.2 State the difference between SRAS and LRAS. [2]

2.3 State one cause of a rightward shift in AD. [1]

3 Exam-style questions

3.1 A cut in income tax is most likely to: [1]

- A shift AD left
- B shift AD right
- C shift SRAS left
- D shift LRAS right

3.2 Using an AD–AS diagram, explain how an increase in aggregate demand affects the price level and real output. [8]

3.3 Discuss whether a rise in aggregate demand always benefits an economy. [12]

Solutions

Economics answers are marked by **level of response** against the assessment objectives: award **AO1** knowledge, **AO2** application, **AO3** analysis and **AO4** evaluation.

2.1 consumption (C), investment (I), government spending (G), net exports ($X - M$) (2 for all four; 1 for two or three).

2.2 SRAS slopes upward and shifts when production costs change; LRAS is vertical and shows full productive capacity, shifting only when factors change (2 for a clear difference; 1 for a partial idea).

2.3 any one of: a rise in $C/I/G$; a tax cut; a fall in interest rates; a rise in exports (1).

3.1 B. A tax cut raises disposable income and consumption, shifting AD right.

3.2 [8] AO1 1 + **AO3 diagram up to 4** (AD shifts right, SRAS upward-sloping, new equilibrium) + AO2/AO3 up to 3 — higher AD raises both the price level and real output along SRAS; near full capacity (steep AS) most of the rise is in prices, while with spare capacity (flat AS) most is in output.

3.3 [12] AO1/AO2/AO3 up to 8 + AO4 up to 4. **For:** higher AD raises output and employment when there is spare capacity. **Against:** near full capacity it mainly causes demand-pull inflation, may worsen the current account (more imports) and is unsustainable. Judgement: the effect depends on how close the economy is to full capacity — beneficial in a recession, inflationary in a boom.
