

3.1 Algebra (partial fractions, rational-power binomial)

Name: _____ Class: _____ Date: _____

Total: 17 marks

Objective

Build the skills to answer exam questions on **further algebra** 代数—**partial fractions** 部分分式 and the **binomial expansion for a rational power** 分数次幂二项展开式.

You must be able to:

- split a rational function into partial fractions (including a repeated factor)
- expand $(1+x)^n$ for fractional/negative n (for $|x| < 1$)
- combine the two (expand after splitting)

1 Worked examples

■ Partial fractions & rational-power binomial

The rational-power binomial series converges only for $|x| < 1$ —the terms must shrink

$$\frac{x+4}{(x+1)(x-2)} = \frac{A}{x+1} + \frac{B}{x-2}; \quad x+4 = A(x-2) + B(x+1); \quad x=2 \Rightarrow B=2;$$

$$x = -1 \Rightarrow A = -1. \text{ So } \frac{2}{x-2} - \frac{1}{x+1}.$$

$$(1+x)^{1/2} = 1 + \frac{1}{2}x - \frac{1}{8}x^2 + \dots \text{ for } |x| < 1.$$

2 Practice

2.1 Find the first three terms of $(1+x)^{-1}$. [2]

2.2 Write $\frac{5}{(x-1)(x+4)}$ in the form $\frac{A}{x-1} + \frac{B}{x+4}$. [3]

3 Exam-style questions

3.1 The expansion of $(1+2x)^{1/2}$ in ascending powers of x begins: [1]

- **A** $1 + x - \frac{1}{2}x^2 + \dots$
- **B** $1 + x + \frac{1}{2}x^2 + \dots$
- **C** $1 + 2x - 2x^2 + \dots$
- **D** $1 - x + x^2 + \dots$

3.2 Express $\frac{9x+5}{(x+1)(2x-1)}$ in partial fractions. [4]

3.3 (a) Express $\frac{2}{(1-x)(1+2x)}$ in partial fractions. [3]

(b) Hence find the expansion of $\frac{2}{(1-x)(1+2x)}$ up to the term in x^2 . [4]

4 Go further

You are now ready for the real exam questions on this subtopic. Open the **3.1 Algebra** past-paper sheet in the Library, or try these in **Practice mode**:

- 9709/31 N25 —Q10 (partial fractions / expansion)
- 9709/31 J25 —Q1 (binomial expansion)
- 9709/31 J25 —Q5 (partial fractions)

Solutions

2.1 $(1+x)^{-1} = 1 - x + x^2 - \dots$.

2.2 $5 = A(x+4) + B(x-1)$; $x = 1 \Rightarrow A = 1$; $x = -4 \Rightarrow B = -1$; $\frac{1}{x-1} - \frac{1}{x+4}$.

3.1 A. $(1+2x)^{1/2} = 1 + \frac{1}{2}(2x) + \frac{(1/2)(-1/2)}{2}(2x)^2 + \dots = 1 + x - \frac{1}{2}x^2 + \dots$.

3.2 $9x + 5 = A(2x-1) + B(x+1)$; $x = -1 \Rightarrow -4 = -3A \Rightarrow A = \frac{4}{3}$; $x = \frac{1}{2} \Rightarrow 9.5 = 1.5B \Rightarrow B = \frac{19}{3}$; $\frac{4}{3(x+1)} + \frac{19}{3(2x-1)}$.

3.3 (a) $2 = A(1+2x) + B(1-x)$; $x = 1 \Rightarrow A = \frac{2}{3}$; $x = -\frac{1}{2} \Rightarrow B = \frac{4}{3}$; $\frac{2/3}{1-x} + \frac{4/3}{1+2x}$.
(b) $\frac{2}{3}(1+x+x^2) + \frac{4}{3}(1-2x+4x^2)$; $= \frac{2}{3} + \frac{4}{3} + (\frac{2}{3} - \frac{8}{3})x + (\frac{2}{3} + \frac{16}{3})x^2$; $= 2 - 2x + 6x^2$.
