

18.2 Uniform electric fields

Name: _____ Class: _____ Date: _____

Total: 19 marks

Objective

Build the skills to answer exam questions on **uniform electric fields** between parallel plates.

You must be able to:

- use $E = V/d$ for the field between parallel plates
- describe the motion of a **charged particle** in a uniform field

1 Worked examples

Study these first. Each one shows the method for a question type used later — follow the steps and you can do the Practice and Exam-style questions yourself.

■ Field between plates

Between parallel plates a distance d apart with p.d. V , the field is **uniform**:

$$E = \frac{V}{d} \quad (\text{V m}^{-1} = \text{N C}^{-1}),$$

pointing from the **higher** to the **lower** potential plate.

■ Charged particle in the field

A charge in the field feels a **constant force** $F = qE$, so it has a **constant acceleration** $a = \frac{F}{m} = \frac{qE}{m}$. A particle entering **perpendicular** to the field follows a **parabolic** path (like a projectile in gravity); a particle released **from rest** accelerates straight along the field, towards the plate of **opposite** sign to its charge.

Worked example. Plates 5.0 mm apart, 200 V: $E = \frac{200}{5.0 \times 10^{-3}} = 4.0 \times 10^4 \text{ V m}^{-1}$; force on an electron = $qE = (1.6 \times 10^{-19})(4.0 \times 10^4) = 6.4 \times 10^{-15} \text{ N}$; acceleration $a = \frac{F}{m} = \frac{6.4 \times 10^{-15}}{9.1 \times 10^{-31}} = 7.0 \times 10^{15} \text{ m s}^{-2}$.

2 Practice

Now apply the methods above.

2.1 Write the equation for the field strength between **parallel plates**. [1]

2.2 Two plates 5.0 mm apart have a p.d. of 200 V. Find the **field strength**. [2]

2.3 State the **direction** of the field between two charged plates. [1]

2.4 State the unit equal to V m^{-1} . [1]

3 Exam-style questions

3.1 The electric field between two parallel charged plates is: [1]

- **A** radial
- **B** uniform
- **C** zero

- **D** circular

3.2 Two plates 5.0 mm apart have a p.d. of 200 V. Calculate (a) the field strength, (b) the force on an electron in the gap. ($e = 1.6 \times 10^{-19}$ C.) [3]

3.3 Describe the **path** of an electron that enters the uniform field **perpendicular** to the field lines. [2]

3.4 State what happens to the force on a charge if the plate separation is **halved** (same p.d.). [1]

3.5 An electron is released from rest at the negative plate of two plates 8.0 mm apart with a p.d. of 250 V. ($e = 1.6 \times 10^{-19}$ C, $m_e = 9.1 \times 10^{-31}$ kg.)

(a) Calculate the field strength between the plates. [2]

(b) Calculate the **acceleration** of the electron. [3]

4 Go further

You are now ready for the real exam questions on this subtopic. Open the **18.2 Uniform electric fields** past-paper sheet in the Library, or try these in **Practice mode**:

- 9702/42 J25 —Q6 (parallel plates, electron acceleration)
- 9702/43 J25 —Q7 (uniform field, structured)
- 9702/42 M25 —Q6 (charged particle in a field)
- 9702/42 M25 —Q2 (field between plates)

Solutions

2.1 $E = V/d$.

2.2 $E = V/d = 200/(5.0 \times 10^{-3}) = 4.0 \times 10^4 \text{ V m}^{-1}$.

2.3 From the **higher-potential** plate to the **lower-potential** plate.

2.4 N C^{-1} .

3.1 **B** —uniform.

3.2 (a) $E = V/d = 200/(5.0 \times 10^{-3}) = 4.0 \times 10^4 \text{ V m}^{-1}$. (b) $F = qE = (1.6 \times 10^{-19})(4.0 \times 10^4) = 6.4 \times 10^{-15} \text{ N}$.

3.3 It follows a **parabolic** path —constant velocity along the plates, constant acceleration across the field (like a projectile).

3.4 The force **doubles** ($E = V/d$, so halving d doubles E and hence $F = qE$).

3.5 (a) $E = V/d = 250/(8.0 \times 10^{-3}) = 3.1 \times 10^4 \text{ V m}^{-1}$.

3.5 (b) $F = qE = (1.6 \times 10^{-19})(3.1 \times 10^4) = 5.0 \times 10^{-15} \text{ N}$; $a = \frac{F}{m} = \frac{5.0 \times 10^{-15}}{9.1 \times 10^{-31}} = 5.5 \times 10^{15} \text{ m s}^{-2}$.
