

7.2 Transverse and longitudinal waves

Name: _____ Class: _____ Date: _____

Total: 14 marks

KEY WORDS longitudinal 纵波 • transverse 横波 • electromagnetic wave 电磁波 • wave 波
• compression 压缩

Objective

Build the skills to answer exam questions on **transverse and longitudinal waves** — comparing them and reading their graphs.

You must be able to:

- compare **transverse** 横波 and **longitudinal** 纵波 waves
- give examples of each and identify **compressions** and **rarefactions**
- interpret displacement–distance and displacement–time graphs

1 Worked examples

Study these first. Each one shows the method for a question type used later — follow the steps and you can do the Practice and Exam-style questions yourself.

■ Transverse vs longitudinal

- **Transverse:** particles vibrate **perpendicular** to the energy travel (rope, all EM waves, water ripples).
- **Longitudinal:** particles vibrate **parallel** to the energy travel; the wave is **compressions** and **rarefactions** (sound, slinky squashes).

A key difference often tested: only **transverse** waves can be **polarised** (restricted to one plane of vibration); longitudinal waves **cannot** (covered fully in 7.5).

A longitudinal wave on a slinky

■ Graphs

Both look like a **sine curve**. A **displacement–distance** graph gives the **wavelength** λ ; a **displacement–time** graph gives the **period** T (then $f = 1/T$).

2 Practice

Now apply the methods above.

2.1 State the difference between a **transverse** and a **longitudinal** wave. [2]

2.2 Give **one** example of a transverse wave and **one** of a longitudinal wave. [2]

2.3 Name the two features that make up a **longitudinal** wave. [1]

2.4 State what you read from a **displacement–time** graph and from a **displacement–distance** graph. [2]

3 Exam-style questions

3.1 Which of these is a **longitudinal** wave? [1]

- | | |
|---|---|
| A | B |
| C | D |
- A light
B a wave on a rope
C sound
D water ripples

3.2 Sound is a longitudinal wave. Describe how the **air particles** move as the wave passes. [2]

3.3 State whether **all electromagnetic waves** are transverse or longitudinal. [1]

3.4 A displacement–time graph for a wave shows a period of 0.020 s. Calculate the **frequency**. [2]

3.5 State **one** property that a **transverse** wave has but a **longitudinal** wave does not. [1]
