

10 (a) State Hubble's law.

.....

 [2]

(b) A star in a distant galaxy emits radiation that has a maximum intensity of emission at a wavelength of $4.62 \times 10^{-7} \text{ m}$.

Observations of the galaxy made on the Earth detect the maximum intensity of emission from the star at a wavelength of $4.91 \times 10^{-7} \text{ m}$.

(i) Explain why the observed wavelength and the emitted wavelength have different values.

.....

 [2]

(ii) Calculate the speed of the star relative to the Earth.

speed = m s^{-1} [2]

(iii) The wavelength of maximum intensity of emission is used to determine a value for the surface temperature of the star.

Explain how the temperature determined using the observed wavelength compares with the true value of temperature determined using the emitted wavelength.

.....

 [2]

(c) A value for the Hubble constant is $2.3 \times 10^{-18} \text{ s}^{-1}$.

Use your answer in **(b)(ii)** to determine the distance of the star in **(b)** from the Earth.

distance = m [2]
