

9 (a) State what is meant by the photoelectric effect.

.....

.....

..... [2]

(b) The photoelectric effect is investigated using two clean metal plates. One plate is made from metal X and the other is made from metal Y.

Metal X has work function energy ϕ . Metal Y has work function energy 2ϕ .
Metal X has threshold frequency F .

State expressions, in terms of either or both of ϕ and F , for

(i) the threshold frequency of metal Y

threshold frequency = [1]

(ii) the Planck constant.

Planck constant = [1]

(c) The maximum kinetic energy E_K of photoelectrons is determined for each of the plates in (b) for different frequencies f of incident radiation.

On Fig. 9.1, sketch the variation of E_K with f for each plate. Label your lines X and Y to identify which line relates to which plate.

9 (a) State what is meant by the photoelectric effect.

.....

.....

..... [2]

(b) The photoelectric effect is investigated in two stages using the circuit shown in Fig. 9.1.

Fig. 9.1

The polished metal plate Y is illuminated with electromagnetic radiation of frequency f and constant power.

In stage 1 of the investigation, frequency f is set to a constant value of 2.5×10^{15} Hz. The current I in the ammeter is varied by adjusting the potentiometer P. Fig. 9.2 shows the variation of I with the voltmeter reading V . There is a value V_S of V at which the current just falls to zero.

In stage 2 of the investigation, stage 1 is repeated for different values of frequency. As frequency f is varied, the voltmeter reading V_S at which the current just falls to zero is measured. Fig. 9.3 shows the variation of V_S with f .

Fig. 9.2

Fig. 9.3

(i) Explain, with reference to photons, why V_S depends on the frequency of the incident electromagnetic radiation.

[3]

(ii) State **three** quantitative conclusions that can be drawn from the results in Fig. 9.2 and Fig. 9.3. Use the space for any working.
