

Solutions

Each answer shows the steps, then the **result**.

2.1

- $\Delta x = \frac{10 - 2}{4} = 2$

2.2

- $\Delta x = \frac{2}{n}, x_k = \frac{2k}{n}; \text{sum} = \sum_{k=1}^n f\left(\frac{2k}{n}\right) \cdot \frac{2}{n}$

2.3

- Integrand $3x + 2$; limits of integration 1 and 5

3.1 B

- the definite integral is the limit of Riemann sums

3.2

(a)

- $\Delta x = \frac{4}{n}$, so $b - a = 4$; the sample $2 + \frac{4k}{n}$ starts at 2, so $[a, b] = [2, 6]$

(b)

- $\int_2^6 x^2 dx$

3.3

- More signed area lies **below** the axis than above it over $[0, 6]$
