

Question 1: Long Answer

10 points

A (i) For the correct plotted lines:

Point 01

The abundance for the two lines should be between 10 and 11.

(ii) For the correct answer:

Point 02

*Magnesium-26 has one more neutron than magnesium-25 does.***B** (i) For a correct explanation:

Point 03

The charge on the sodium ion is less than the charge on the magnesium ion. A smaller charge results in a weaker Coulombic attraction between Na^+ and water.

(ii) For a correct explanation:

Point 04

*The Na^+ ion is larger than the Mg^{2+} ion, so the distance between the Na^+ and the oxygen on the water molecule will be greater. As distance increases, Coulombic attraction decreases.***C** For the correct calculated value:

Point 05

$$\text{pOH} = -\log(2.80 \times 10^{-4}) = 3.553$$

$$\text{pH} = 14 - \text{pOH} = 14 - 3.553 = 10.447$$

D For the correct calculated value:

Point 06

$$M_1V_1 = M_2V_2$$

$$M_2 = \frac{(1.85 \times 10^{-3} M)(0.03500 \text{ L})}{(0.03500 \text{ L} + 0.05000 \text{ L})} = 7.62 \times 10^{-4} M$$

E	(i) For the correct expression: $K_{sp} = [\text{Mg}^{2+}][\text{OH}^-]^2$	Point 07
	(ii) For the correct calculated value, consistent with part D and part E (i): $Q = [\text{Mg}^{2+}][\text{OH}^-]^2 = (7.62 \times 10^{-4})(1.65 \times 10^{-4})^2 = 2.07 \times 10^{-11}$	Point 08
	(iii) For the correct prediction and justification, consistent with part E (ii). Examples of acceptable responses may include the following: • $Q > K_{sp}$, so a precipitate will form. • The concentration of the ions in solution (represented by Q) is greater than that of a saturated solution, so a precipitate will form.	Point 09
F	For the correct answer and justification: <i>Decrease. The H^+ from $\text{HNO}_3(\text{aq})$ will react with OH^-, decreasing $[\text{OH}^-]$ and causing $Q < K_{sp}$. As a result, more $\text{Mg}(\text{OH})_2(\text{s})$ will dissolve until equilibrium is reestablished, resulting in less $\text{Mg}(\text{OH})_2(\text{s})$.</i>	Point 10

Question 2: Long Answer

10 points

A (i) For the correct calculated value: **Point 01**

$$2.883 \text{ g H}_2\text{O} \times \frac{1 \text{ mol H}_2\text{O}}{18.02 \text{ g H}_2\text{O}} = 0.1600 \text{ mol H}_2\text{O}$$

(ii) For the correct calculated number of moles of H (may be implicit): **Point 02**

$$0.1600 \text{ mol H}_2\text{O} \times \frac{2 \text{ mol H}}{1 \text{ mol H}_2\text{O}} = 0.3200 \text{ mol H}$$

For the correct empirical formula. **Point 03**

Examples of acceptable responses may include the following:

- $x : y : z = (\text{moles of C}) : (\text{moles of H}) : (\text{moles of O})$

$$x : y : z = 0.2400 : 0.3200 : 0.2400 = 3 : 4 : 3$$

Therefore, the empirical formula of ascorbic acid is $\text{C}_3\text{H}_4\text{O}_3$.

- $0.2400 \text{ mol CO}_2 \times \frac{1 \text{ mol C}}{1 \text{ mol CO}_2} = 0.2400 \text{ mol C}$

$$\frac{0.3200 \text{ mol H}}{0.2400 \text{ mol C}} = \frac{4 \text{ H}}{3 \text{ C}}$$

Given that the ratio of C:O is 1:1, the empirical formula of ascorbic acid is

B (i) For the correct calculated value: **Point 04**

$$0.0160 \text{ L NaOH} \times \frac{0.0550 \text{ mol NaOH}}{1 \text{ L NaOH}} \times \frac{1 \text{ mol HAsc}}{1 \text{ mol NaOH}} = 8.80 \times 10^{-4} \text{ mol HAsc}$$

$$\frac{8.80 \times 10^{-4} \text{ mol HAsc}}{0.0100 \text{ L}} = 0.0880 \text{ M HAsc}$$

(ii) For the correct $\text{p}K_a$: **Point 05**

4.1 (acceptable range: 4.0–4.3)

(iii) For the correct ratio, consistent with part B (ii): **Point 06**

Using the Henderson-Hasselbalch equation:

$$\text{pH} = \text{p}K_a + \log\left(\frac{[\text{Asc}^-]}{[\text{HAsc}]}\right)$$

$$4.7 = 4.1 + \log\left(\frac{[\text{Asc}^-]}{[\text{HAsc}]}\right)$$

$$\frac{[\text{Asc}^-]}{[\text{HAsc}]} = 10^{0.6} = 4.0$$

C (i) For a correct explanation.**Point 07**

Examples of acceptable responses may include the following:

- $\frac{4.914 \times 10^{-4}}{2.457 \times 10^{-4}} = \left(\frac{0.900}{0.450}\right)^a$, thus $a = 1$
- *Comparing trials 1 and 3, the rate doubles when the concentration of ascorbic acid is doubled and the triiodide ion concentration is constant, indicating that the process is first order with respect to ascorbic acid.*

(ii) For the correct calculated value:**Point 08**

$$\text{rate} = k[\text{HAsc}][\text{I}_3^-]$$

Using trial 1 data:

$$k = \frac{\text{rate}}{[\text{HAsc}][\text{I}_3^-]} = \frac{2.457 \times 10^{-4} \text{ M/s}}{(0.450 \text{ M})(1.200 \text{ M})} = 4.55 \times 10^{-4} \text{ M}^{-1} \text{ s}^{-1}$$

For the correct units:**Point 09**

$$\text{M}^{-1} \text{ s}^{-1}$$

D For the correct answer:**Point 10**

Ion-dipole attractions are present between I_3^- ions and water but not between I_2 molecules and water.

Question 3: Long Answer

10 points

A For the correct diagram: **Point 01**

B (i) For a correct explanation: **Point 02**

Because gas particles are more dispersed (have more microstates) than solids, the entropy decreases as the reactants (which include a gas) convert to the solid product.

(ii) For the correct answer and a valid justification: **Point 03**

Yes. Given that $\Delta G_{rxn}^{\circ} = \Delta H_{rxn}^{\circ} - T\Delta S_{rxn}^{\circ}$, the reaction must have $\Delta G_{rxn}^{\circ} < 0$ to be favorable. Because the reaction is exothermic, $\Delta H_{rxn}^{\circ} < 0$ and enthalpy contributes to favorability. $\Delta S_{rxn}^{\circ} < 0$, so entropy does not contribute to favorability.

C (i) For the correct calculated value reported with the correct number of significant figures: **Point 04**

$$q = mc\Delta T = (100.1 \text{ g})(4.18 \text{ J/(g}\cdot^{\circ}\text{C)})(22.38^{\circ}\text{C} - 22.00^{\circ}\text{C})$$

$$q = 160 \text{ J} = 0.16 \text{ kJ}$$

(ii) For the correct calculated value, consistent with part C (i): **Point 05**

$$q_{rxn} = -q_{surr} = -0.16 \text{ kJ}$$

$$\Delta H_{rxn}^{\circ} = \frac{-0.16 \text{ kJ}}{0.100 \text{ g P}_4\text{O}_{10}} \times \frac{283.9 \text{ g P}_4\text{O}_{10}}{1 \text{ mol P}_4\text{O}_{10}} \times \frac{1 \text{ mol P}_4\text{O}_{10}}{1 \text{ mol}_{rxn}} = -450 \text{ kJ/mol}_{rxn}$$

For the correct sign: **Point 06**

$$-450 \text{ kJ/mol}_{rxn}$$

D For the correct answer and a valid justification: **Point 07**

Less than. If less P_4O_{10} is present, less thermal energy will be transferred to the water during the reaction, causing the temperature increase to be less than it was with 0.100 g of P_4O_{10} .

E For the correct calculated value:

Point 08

Using Hess's law:

$$\Delta H_{f, \text{PCl}_5(g)}^\circ = \frac{1}{4} \Delta H_1^\circ + \Delta H_2^\circ$$

$$\Delta H_{f, \text{PCl}_5(g)}^\circ = \frac{1}{4}(-1148) + (-88) = -375 \text{ kJ/mol}$$

F (i) For the correct calculated value:

Point 09

$$K_p = \frac{P_{\text{PCl}_5}}{(P_{\text{PCl}_3})(P_{\text{Cl}_2})} = \frac{4.00}{(2.00)(6.00)} = \frac{1}{3} = 0.333$$

(ii) For the correct answer and a valid justification:

Point 10

Decrease. The negative value of ΔH_2° indicates that the reaction is exothermic. Because exothermic reactions favor reactant formation at higher temperature, the value of K_p decreases.

Question 6: Short Answer

4 points

A For the correct equation (state symbols not required): **Point 01**

B For the correct balanced net ionic equation (state symbols not required): **Point 02**

C For the correct answer and a valid justification that correctly compares the masses of Al and Zn based on their molar masses and the stoichiometry of the balanced equation. **Point 03**

Examples of acceptable responses may include the following:

- Zn experiences a greater change in mass. Assuming the entire Al anode reacts:

$$50.0 \text{ g Al} \times \frac{1 \text{ mol Al}}{26.98 \text{ g Al}} \times \frac{3 \text{ mol Zn}}{2 \text{ mol Al}} \times \frac{65.38 \text{ g Zn}}{1 \text{ mol Zn}} = 182 \text{ g Zn}$$

- Zn experiences a greater change in mass.

$$1 \text{ mol}_{\text{rxn}} \times \frac{3 \text{ mol Zn}}{1 \text{ mol}_{\text{rxn}}} \times \frac{65.38 \text{ g Zn}}{1 \text{ mol Zn}} = 196.1 \text{ g Zn}$$

$$1 \text{ mol}_{\text{rxn}} \times \frac{2 \text{ mol Al}}{1 \text{ mol}_{\text{rxn}}} \times \frac{26.98 \text{ g Al}}{1 \text{ mol Al}} = 53.96 \text{ g Al}$$

Thus, for however many moles of reaction that proceed, the mass of Zn produced will be greater than the mass of Al consumed.

- Zn experiences a greater change in mass. As the reaction proceeds, three moles of Zn are used for every two moles of Al. Thus, for every 196 g of Zn that are produced, 54 g of Al are consumed.

D For the correct calculated value. **Point 04**

Examples of acceptable responses may include the following:

- $E_{\text{cell}}^{\circ} = 1.50 \text{ V} + 0.76 \text{ V} = 2.26 \text{ V}$

$$E_{\text{cell}}^{\circ} = 2.26 \text{ V}$$

Question 2: Long Answer

10 points

- (a) (i) For the correct calculated value: 1 point

$$0.0114 \text{ mol CO}_2 \times \frac{44.01 \text{ g}}{1 \text{ mol}} = 0.502 \text{ g CO}_2$$

- (ii) For the correct calculated value: 1 point

$$PV = nRT$$

$$V = \frac{nRT}{P} = \frac{(0.0114 \text{ mol})(0.08206 \frac{\text{L}\cdot\text{atm}}{\text{mol}\cdot\text{K}})(293 \text{ K})}{1.25 \text{ atm}} = 0.219 \text{ L}$$

Total for part (a) 2 points

- (b) (i) For a correct claim: 1 point

The surface area of the solid reactants increases.

- (ii) For the correct answer and a valid justification: 1 point

Shorter than. The powdered solids have a larger surface area than the solid chunks, thus collisions between water and the surface particles occur more frequently, resulting in a faster rate of dissolution and a shorter amount of time to dissolve the solids.

- (iii) For the correct answer and a valid justification: 1 point

Equal to. Both experiments begin with the same amount of reactants, so they will produce the same number of moles of CO₂(g) under the same conditions of pressure and temperature; therefore, the final volume will be the same.

Total for part (b) 3 points

- (c) For the correct answer and a valid justification: 1 point

Accept one of the following:

- NaHCO₃ is the limiting reactant because changing the mass of NaHCO₃ alters the amount of CO₂ produced.
- NaHCO₃ is the limiting reactant because the amount present has a smaller theoretical yield of the CO₂ product.

$$1.543 \text{ g H}_2\text{C}_4\text{H}_2\text{O}_4 \times \frac{1 \text{ mol H}_2\text{C}_4\text{H}_2\text{O}_4}{116.07 \text{ g}} \times \frac{2 \text{ mol CO}_2}{1 \text{ mol H}_2\text{C}_4\text{H}_2\text{O}_4} = 0.02659 \text{ mol CO}_2$$

$$1.251 \text{ g NaHCO}_3 \times \frac{1 \text{ mol NaHCO}_3}{84.01 \text{ g}} \times \frac{2 \text{ mol CO}_2}{2 \text{ mol NaHCO}_3} = 0.01489 \text{ mol CO}_2$$

- (d) For a valid explanation: 1 point

The entropy change is positive because the aqueous reactants produce 2 moles of gas particles, according to the balanced chemical equation. Gases are far more dispersed (occupy a greater number of microstates) than condensed phases, so the entropy of the products is greater than that of the reactants.

(e) For the correct answer and a valid justification: 1 point

Accept one of the following:

- *Disagree. The reaction is endothermic and has a positive entropy change. Thus, the reaction is only thermodynamically favorable at a high enough temperature such that the magnitude of $-T\Delta S$ is greater than that of ΔH .*
- *Disagree. For the reaction to be thermodynamically favorable ($\Delta G < 0$) at all temperatures, the reaction must be exothermic ($\Delta H < 0$) and have a positive entropy change ($\Delta S > 0$).*

(f) For the correct calculated value: 1 point

$$\text{p}K_{a_2} = -\log(8.5 \times 10^{-7}) = 6.07$$

(g) For the correct calculated value: 1 point

$$\text{pH} = \text{p}K_{a_2} + \log \frac{[\text{C}_4\text{H}_2\text{O}_4^{2-}]}{[\text{HC}_4\text{H}_2\text{O}_4^-]}$$
$$\frac{[\text{C}_4\text{H}_2\text{O}_4^{2-}]}{[\text{HC}_4\text{H}_2\text{O}_4^-]} = 10^{(\text{pH} - \text{p}K_{a_2})} = 10^{(7.00 - 6.07)} = 8.5$$

Total for question 2 10 points

Question 3: Long Answer

10 points

(a) For the correct answer: 1 point

(b)(i) For a valid explanation: 1 point

Silver and copper have similar radii, so the alloy would be substitutional versus interstitial.

(ii) For a valid explanation: 1 point

Silver has more occupied electron shells ($n = 5$) than copper ($n = 4$); the electrons in the fifth shell experience weaker Coulombic attractions and are farther away from the nucleus.

Total for part (b) 2 points

(c) For the correct calculated mass of Ag_2S (may be implicit): 1 point

$$409.21 \text{ g} - 398.94 \text{ g} = 10.27 \text{ g}$$

For the correct calculated moles of Ag: 1 point

$$10.27 \text{ g} \times \frac{1 \text{ mol Ag}_2\text{S}}{247.80 \text{ g Ag}_2\text{S}} \times \frac{2 \text{ mol Ag}}{1 \text{ mol Ag}_2\text{S}} = 0.08289 \text{ mol Ag}$$

Total for part (c) 2 points

(d)(i) For the correct balanced equation (state symbols not required): 1 point

(ii) For the correct calculated value, consistent with part (d)(i): 1 point

$$E_{\text{cell}}^{\circ} = +0.80 \text{ V} - 1.23 \text{ V} = -0.43 \text{ V}$$

(iii) For a correct explanation, consistent with part (d)(ii): 1 point

E_{cell}° is negative, which means the reaction is not thermodynamically favorable.

Total for part (d) 3 points

(e) For the correct calculated value of moles of electrons (may be implicit): 1 point

$$2.8 \text{ g Rh} \times \frac{1 \text{ mol Rh}}{102.9 \text{ g Rh}} \times \frac{3 \text{ mol } e^{-}}{1 \text{ mol Rh}} = 0.082 \text{ mol } e^{-}$$

For the correct calculated value of time: 1 point

$$0.082 \text{ mol } e^{-} \times \frac{96,485 \text{ C}}{1 \text{ mol } e^{-}} \times \frac{1 \text{ second}}{2.0 \text{ C}} = 3900 \text{ seconds}$$

Question 1: Long Answer**10 points**

(a) (i) For the correct answer: **1 point**

Accept one of the following:

- $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^5$
- $[\text{Ar}] 4s^2 3d^5$

(ii) For the correct answer, consistent with part (a)(i): **1 point**

$4s$

Total for part (a) 2 points

(b) For the correct calculated value: **1 point**

$$62.673 \text{ g} - 61.262 \text{ g} = 1.411 \text{ g Cl}$$

(c) For the correct calculated value, consistent with part (b): **1 point**

$$1.411 \text{ g Cl} \times \frac{1 \text{ mol Cl}}{35.45 \text{ g Cl}} = 0.03980 \text{ mol Cl}$$

(d) For the correct answer, consistent with part (c): **1 point**

$$\frac{0.03980 \text{ mol Cl}}{0.0199 \text{ mol Mn}} = \frac{2 \text{ mol Cl}}{1 \text{ mol Mn}} \Rightarrow \text{MnCl}_2$$

(e) For the correct answer and a valid justification: **1 point**

Less than. If some of the mass of aqueous Mn_xCl_y is lost due to splattering, the final mass of the dry beaker and Mn_xCl_y will be decreased, which will decrease the calculated mass and number of moles of chlorine in the dry solid.

(f) (i) For the correct balanced equation: **1 point**

(ii) For the correct calculated value, consistent with part (f)(i): **1 point**

$$E_{\text{cell}}^{\circ} = 0.15 \text{ V} - (-1.28 \text{ V}) = 1.43 \text{ V}$$

(iii) For the correct calculated value, consistent with part (f)(ii): **1 point**

$$\Delta G^{\circ} = -nFE^{\circ} = -\frac{2 \text{ mol } e^-}{1 \text{ mol}_{\text{rxn}}} \times \frac{96,485 \text{ C}}{1 \text{ mol } e^-} \times \frac{1.43 \text{ J}}{1 \text{ C}} \times \frac{1 \text{ kJ}}{1000 \text{ J}} = -276 \text{ kJ/mol}_{\text{rxn}}$$

(iv) For the correct answer and a valid justification: **1 point**

Accept one of the following:

- *Disagree. The battery is enclosed, so no change in the total mass will occur.*
- *Disagree. All reactants and products are in the solid phase, so the mass of the sealed battery will remain the same (no gases enter or exit the battery).*

$$K_p = \frac{P_{\text{Al}_2\text{Cl}_6}}{(P_{\text{AlCl}_3})^2}$$

(f) For the correct calculated value, consistent with part (e): **1 point**

$$K_p = \frac{\chi_{\text{Al}_2\text{Cl}_6}(P_{\text{total}})}{(\chi_{\text{AlCl}_3}(P_{\text{total}}))^2} = \frac{\frac{3}{10}(22.1)}{\left(\frac{7}{10}(22.1)\right)^2} = 0.0277$$

Total for question 2 10 points

Question 3: Long Answer**10 points**

(a) For the correct balanced equation (state symbols not required): **1 point**

Accept one of the following:

- $\text{CaCO}_3(s) + 2 \text{H}^+(aq) \rightarrow \text{Ca}^{2+}(aq) + \text{CO}_2(g) + \text{H}_2\text{O}(l)$
- $\text{CaCO}_3(s) + 2 \text{H}_3\text{O}^+(aq) \rightarrow \text{Ca}^{2+}(aq) + \text{CO}_2(g) + 3 \text{H}_2\text{O}(l)$

(b) For a correct explanation: **1 point**

Accept one of the following:

- *Even though the concentration of HCl is greater in trial 5 than in trial 2, the reaction time is significantly longer. Both trial 2 and 5 occur under otherwise identical conditions. The trend for trial 1 and 4 indicates that the higher concentration of HCl results in a shorter time of reaction.*
- *The time of reaction in trial 5, with small chunks of calcium carbonate, is longer than trial 6 with large chunks. Both trial 5 and 6 occur under otherwise identical conditions. The trend for trials 1, 2, and 3 shows that larger chunks of the solid result in longer time of reaction.*

(c) For a correct explanation of the effect of surface area on reaction time: **1 point**

The time of reaction in trial 2 is shorter than that in trial 3 because the calcium carbonate in trial 2 has a larger surface area (meaning that more particles of calcium carbonate are exposed to the H^+ particles in the solution).

For a correct explanation of the effect of particle collisions on reaction rate: **1 point**

The larger interface between the two reacting substances means there will be more collisions between the particles in a given amount of time, and thus, a higher frequency of successful collisions in which the particles react to form the products.

Total for part (c) 2 points

(d) For the correct answer and a valid justification: **1 point**

Accept one of the following:

- *Disagree. If the reaction was zeroth order with respect to HCl, then changing the concentration of HCl would not affect the rate of reaction, and the time of reaction would be the same for trials in which the only difference was [HCl]. The student's data for trials 1 and 4 (likewise for 3 and 6) show that changing [HCl] significantly alters the time of reaction.*
- *Disagree. The reaction appears to be first order, not zeroth order, with respect to [HCl]. Tripling [HCl] results in a reaction time that is 1/3 of that when [HCl] = 1.00 M, which means the reaction rate has also tripled, indicating a first-order process.*

(e) For the correct calculated moles of HCl reacted (may be implicit): **1 point**

$$1.00 \text{ g CaCO}_3 \times \frac{1 \text{ mol}}{100.09 \text{ g}} = 0.00999 \text{ mol CaCO}_3$$

$$0.00999 \text{ mol CaCO}_3 \times \frac{2 \text{ mol HCl}}{1 \text{ mol CaCO}_3} = 0.0200 \text{ mol HCl reacted}$$

For the correct calculated [HCl] remaining, consistent with the number of moles reacted: **1 point**

$$0.0500 \text{ L} \times \frac{1.00 \text{ mol HCl}}{1 \text{ L}} = 0.0500 \text{ mol HCl initially present}$$

$$0.0500 \text{ mol} - 0.0200 \text{ mol} = 0.0300 \text{ mol remaining}$$

$$\frac{0.0300 \text{ mol}}{0.0500 \text{ L}} = 0.600 \text{ M HCl remaining}$$

Total for part (e) 2 points

(f) For the correct answer and a valid justification: **1 point**

Exothermic. The solution temperature increases as the reaction proceeds.

(g)(i) For the correct calculated value (sign not required): **1 point**

$$q_{\text{surr}} = mc\Delta T = (51.0 \text{ g})(4.0 \frac{\text{J}}{\text{g}\cdot^\circ\text{C}})(21.90^\circ\text{C} - 21.20^\circ\text{C}) = 140 \text{ J}$$

(ii) For the correct calculated value, consistent with (g)(i), and the correct sign, consistent with (f): **1 point**

$$q_{\text{sys}} = -q_{\text{surr}} = -140 \text{ J} = -0.14 \text{ kJ}$$

$$1.00 \text{ g CaCO}_3 \times \frac{1 \text{ mol CaCO}_3}{100.09 \text{ g CaCO}_3} \times \frac{1 \text{ mol}_{\text{rxn}}}{1 \text{ mol CaCO}_3} = 0.00999 \text{ mol}_{\text{rxn}}$$

$$\Delta H_{\text{rxn}}^\circ = \frac{-0.14 \text{ kJ}}{0.00999 \text{ mol}_{\text{rxn}}} = -14 \text{ kJ/mol}_{\text{rxn}}$$

Total for part (g) 2 points

(a) For the correct calculated value: **1 point**

$$0.00250 \text{ mol CH}_3\text{NH}_3\text{Cl} \times \frac{67.52 \text{ g}}{1 \text{ mol}} = 0.169 \text{ g}$$

(b) For a correct description of step 1: **1 point**

Accept one of the following:

- *Use the spatula, balance, and weighing paper to measure out exactly 0.169 g of CH₃NH₃Cl(s).*
- *Use the balance to weigh out the mass of solid in part (a).*

For a correct description of step 4: **1 point**

Rinse the buret with a small amount of 0.100 M CH₃NH₂(aq), drain, and refill with 0.100 M CH₃NH₂(aq).

Total for part (b) 2 points

(c) For the correct answer and a valid justification: **1 point**

Equal to. The ratio of weak acid to conjugate base is still 1:1.

Total for question 4 4 points

Question 1: Long Answer

10 points

(a) For the correct calculated value: 1 point

$$0.300 \text{ g C}_8\text{H}_8\text{O}_3 \times \frac{1 \text{ mol C}_8\text{H}_8\text{O}_3}{152.15 \text{ g}} \times \frac{1 \text{ mol HC}_7\text{H}_5\text{O}_3}{1 \text{ mol C}_8\text{H}_8\text{O}_3} \times \frac{138.12 \text{ g}}{1 \text{ mol HC}_7\text{H}_5\text{O}_3} = 0.272 \text{ g HC}_7\text{H}_5\text{O}_3$$

(b) For the correct answer and a valid justification: 1 point

Yes (consistent). Because the acid is soluble in water, some crystals may dissolve during rinsing, causing the mass of the collected precipitate to be lower than expected. This would lead to a percent yield less than 100%.

(c) For the correct calculated value of either q : 1 point

Accept one of the following:

- $q_{\text{heat}} = mc\Delta T = (0.105 \text{ g})(1.17 \text{ J/(g} \cdot ^\circ\text{C)})(159^\circ\text{C} - 25^\circ\text{C}) = 16.5 \text{ J}$
- $q_{\text{melt}} = 0.105 \text{ g} \times \frac{1 \text{ mol}}{138.12 \text{ g}} \times \frac{27,100 \text{ J}}{1 \text{ mol}} = 20.6 \text{ J}$

For the correct calculated value of the other q and the total heat: 1 point

$$q_{\text{total}} = q_{\text{heat}} + q_{\text{melt}} = 16.5 \text{ J} + 20.6 \text{ J} = 37.1 \text{ J}$$

Total for part (c) 2 points

(d) For a correct explanation: 1 point

Molecules of salicylic acid have more hydrogen bonding sites than molecules of methyl salicylate have, which leads to stronger intermolecular forces and a higher melting point for salicylic acid.

(e) For the correct answer: 1 point

The $\text{p}K_a$ is approximately 3.

(f) For the correct answer and a valid justification, consistent with part (e): 1 point

Accept one of the following:

- *The conjugate base, $\text{C}_7\text{H}_5\text{O}_3^-$. When $\text{pH} = 4$, the titration is beyond the half-equivalence point, where $[\text{HC}_7\text{H}_5\text{O}_3] = [\text{C}_7\text{H}_5\text{O}_3^-]$. Thus, $[\text{C}_7\text{H}_5\text{O}_3^-]$ must be greater than $[\text{HC}_7\text{H}_5\text{O}_3]$.*
- *The conjugate base, $\text{C}_7\text{H}_5\text{O}_3^-$. Because the pH of the solution is greater than the $\text{p}K_a$ of the acid, the majority of the molecules will be deprotonated.*

(g) For the correct calculated value: 1 point

$$\text{p}K_a = -\log(6.3 \times 10^{-5}) = 4.20$$

(h) For a curve that shows a correct starting and half-equivalence point, consistent with part (g): **1 point**

The curve starts at $\text{pH} \approx 3.11$ and passes through the pK_a calculated in part (g) at 5 mL.

See example response below.

For a curve that shows the correct equivalence point:

1 point

The curve inflects vertically at 10 mL showing the same volume of base needed to reach the equivalence point.
