

Question 1: Long Answer

10 points

- (a) For the correct circled atom: 1 point

The rightmost hydrogen atom should be circled.

- (b) For the correct calculated value: 1 point

$$\frac{(10.22 \text{ g}) \left(\frac{1 \text{ mol}}{40.00 \text{ g}} \right)}{0.500 \text{ L}} = 0.511 \text{ M}$$

- (c) For the correct
- $\text{p}K_a$
- : 1 point

3.9 (acceptable range: 3.7 – 4.0)

- (d) (i) For the X at the correct point: 1 point

The X should be at a point greater than or equal to 3 mL and less than 8 mL.

- (ii) For a correct justification: 1 point

More acid particles are present than conjugate base particles, meaning that the titration is before the half-equivalence point.

- (iii) For a curve showing the correct equivalence point: 1 point

The equivalence point should be at 8 mL. See example response below.

For a curve with appropriate initial and final pH with a correct shape: 1 point

The drawn curve should begin at the same pH, gradually increase, rise sharply at a volume different than 16 mL, and end at a pH similar to the first curve.

Total for part (d) 4 points

- (e) (i) For the correct calculated value: 1 point

$$q = mc\Delta T = (200.0 \text{ g})(4.2 \text{ J/(g} \cdot ^\circ\text{C)})(23.2^\circ\text{C} - 20.0^\circ\text{C}) = 2700 \text{ J}$$

- (ii) For the correct calculated value: 1 point

$$q_{\text{rxn}} = -q_{\text{soln}} = -2700 \text{ J} = -2.7 \text{ kJ}$$

$$\Delta H_{\text{rxn}} = \frac{q_{\text{rxn}}}{\text{mol}} = \frac{-2.7 \text{ kJ}}{(0.100 \text{ L})(0.500 \text{ mol/L})} = -54 \text{ kJ/mol}_{\text{rxn}}$$

- (iii) For the correct answer and a valid justification: 1 point

Agree. The heat lost from the system would result in a lower final temperature, which results in values of ΔT , q_{soln} , and ΔH that are smaller than the actual value.

Total for part (e) 3 points
