

3 Writing a class – Part 1

Name: _____ Class: _____ Date: _____

Vocabulary 词汇

Write each word three times. 把每个单词抄写三遍。

English	中文	Write it 3 times (English)
class	类	_____
constructor	构造函数	_____

Recall

In earlier sheets you **used** objects like **String**. Now you will **build your own**:

- A **String** is one type of object; you can design your own types too.
- A class is like a blueprint for making objects.

This sheet lines up how to write a class. Each idea has a worked example.

New ideas

■ 1 A class is a blueprint

A **class** 类 is a blueprint that describes what its objects hold and do. From one class you make many objects.

■ 2 Fields

A class's **fields** are its data – the values each object stores:

```
public class Student {
    private String name;
    private int score;
}
```

■ 3 The constructor

A **constructor** 构造函数 sets up a new object when you use **new**:

```
public Student(String n, int s) {
    name = n;
    score = s;
}
```

■ 4 Making objects

```
Student a = new Student("Amy", 80);
```

Each **new** builds a separate object with its own **name** and **score**.

Watch out: a class is only a **blueprint** – it does nothing by itself. You must create an object with **new** before you can use it, just as a house plan is not a house.

Practice

Try these in order. The methods are all above.

2.1 State the difference between a class and an object. [2]

2.2 State what the “fields” of a class are. [1]

2.3 State what a constructor does. [2]

2.4 Write a line that creates a **Student** object called **b** with name “Ben” and score 70. [2]

2.5 Explain why you can make many different objects from one class. [2]
