

5.7 Meat Production Methods

Name: _____ Class: _____ Date: _____

Total: 10 marks

KEY WORDS methane 甲烷

Objective

Build the skills to answer exam questions on **meat production methods**.

You must be able to:

- compare **feedlots (CAFOs)** and **free-range** methods
- explain the high resource cost of meat
- link meat to greenhouse gases and land/water use

1 Worked examples

Study these first. Each one shows the method for a question type used later — follow the steps and you can do the Practice and Exam-style questions yourself.

■ Two methods

- **Feedlots (CAFOs)** — animals densely confined, fed grain; high output but concentrated **waste** and antibiotic use.
- **Free-range/grazing** — animals roam and graze; lower waste concentration but needs more land.

■ Meat is resource-intensive

Producing meat needs far more **land, water, and grain** than plant food, because energy is lost moving up the trophic level (the 10% rule) — feeding grain to animals is inefficient.

■ Greenhouse gases

Livestock (especially cattle) release **methane**, a potent greenhouse gas; manure and feed production add more emissions.

■ A worked comparison

A kilogram of beef needs far more water and grain than a kilogram of grain eaten directly, because most of the feed's energy is lost as the animal lives.

2 Practice

Now apply the methods above.

2.1 What is a feedlot (CAFO)? [1]

2.2 Why does meat require more resources than plant food? [1]

2.3 Which greenhouse gas do cattle release? [1]

3 Exam-style questions

3.1 Producing meat is less efficient than eating plants directly because of [1]

A	B
C	D

A the 10% rule (energy lost between trophic levels)

B photosynthesis

C the water cycle

D plate tectonics

3.2 A region shifts from grain farming to beef feedlots.

(a) State two environmental impacts. [2]

(b) Explain why more grain is needed to produce the same food energy as meat. [2]

3.3 Explain one advantage and one disadvantage of free-range meat production versus feedlots. [2]
