

5.6 Newton's Second Law in Rotational Form

Name: _____ Class: _____ Date: _____

Total: 9 marks

KEY WORDS angular velocity 角速度 • torque 力矩 • angular acceleration 角加速度
• rotational inertia 转动惯量

Objective

Build the skills to answer exam questions on **Newton's second law in rotational form**.

You must be able to:

- state **Newton's second law for rotation** 转动的牛顿第二定律, $\tau_{net} = I\alpha$
- determine the **angular acceleration** produced by a given net torque
- explain that a larger **rotational inertia** gives a smaller angular acceleration for the same torque
- analyse systems combining translation and rotation, such as a mass on a pulley

1 Worked examples

Study these first. Each one shows the method for a question type used later.

■ Rotational Newton's second law

$\tau_{net} = I\alpha$ — the rotational analogue of $F = ma$ (with $\tau \leftrightarrow F$, $I \leftrightarrow m$, $\alpha \leftrightarrow a$).

■ Larger inertia, smaller acceleration

For a fixed net torque, a bigger I gives a smaller α .

■ Example

A net torque of 6.0 N m on a body of $I = 2.0 \text{ kg m}^2$ gives $\alpha = \frac{6.0}{2.0} = 3.0 \text{ rad s}^{-2}$.

2 Practice

2.1 A net torque of 12 N m acts on a wheel of $I = 3.0 \text{ kg m}^2$. Find its angular acceleration. [1]

2.2 State how the angular acceleration changes if the rotational inertia doubles for the same torque. [1]

2.3 A disc of $I = 0.50 \text{ kg m}^2$ gains an angular acceleration of 8.0 rad s^{-2} . Find the net torque acting on it. [1]

3 Exam-style questions

3.1 The rotational form of Newton's second law is [1]

- | | |
|---|---|
| A | B |
| C | D |
- A** $F = ma$
B $\tau = I\alpha$
C $p = mv$
D $L = I\omega$

3.2 For a fixed net torque, doubling the rotational inertia makes the angular acceleration [1]

- | | |
|---|---|
| A | B |
| C | D |
- A** twice as large
B half as large
C unchanged
D four times as large

3.3 A torque of 5.0 N m acts on a disc of rotational inertia 0.25 kg m^2 , initially at rest.

- (a) Find the angular acceleration. [2]
- (b) Find the angular velocity after 4.0 s . [2]
