

Question 1: Version J

1. Very long Wire 1 carries current I in the $+x$ -direction along the line $y = 0$. Very long Wire 2 carries current I in the $+x$ -direction along the line $y = +d$. Point P is located along Wire 1 at the origin, as shown in Figure 1. The diameters of the wires are small compared to the distance between the wires. Both wires are in the xy -plane.

Figure 1

Note: Figure not drawn to scale.

A.

- i. Complete the following tasks in figures 2 and 3. Use either arrows or the symbols shown in the box above the figures for your response.

- **Indicate** the direction of the magnetic field from Wire 2 at Point P in Figure 2.
- **Indicate** the direction of the magnetic force that is exerted on Wire 1 by Wire 2 in Figure 3.

Magnetic Force on Wire 1
by Wire 2

Figure 3

- ii. Very long Wire 3 carrying current $2I$ in the $+x$ -direction is placed in the xy -plane along the line $y = y_3$. The net magnetic force exerted on Wire 1 by the currents in wires 2 and 3 is zero.

Derive an expression for y_3 in terms of d . Begin your derivation by writing a fundamental physics principle or an equation from the reference information.

- B. Wire 3 is moved very far away from wires 1 and 2. A circular conducting loop in the xy -plane is initially held at rest below Wire 1. The loop is then moved at a constant speed in the $-y$ -direction, as shown in Figure 4.

Figure 4

Note: Figure not drawn to scale.

Indicate whether there is a clockwise induced current in the loop, a counterclockwise induced current in the loop, or no induced current in the loop.

_____ Clockwise

_____ Counterclockwise

_____ There is no induced current in the loop.

Justify your answer.

(10 points, suggested time 20 minutes)

At the instant shown above, a negatively charged object is moving to the left with constant velocity v near a long, straight wire that has a current I directed to the left. The region contains a uniform electric field of magnitude E , and the charged object is at a distance d from the wire. The figure shows the electric and magnetic forces, F_E and F_M , respectively, exerted on the charged object.

- (a) Derive an expression for v in terms of E , d , I , and physical constants, as appropriate.

- (b) The charged object is removed, and a square coil with side length $2L$ is placed near the long, straight wire, as shown above. The bottom of the coil is a distance L from the wire. The magnitude of the magnetic field due to the current in the wire is $3B_0$ at point P_1 and B_0 at point P_2 .

- i. Write an "X" at a location on the figure where the magnitude of the magnetic field is $2B_0$. Briefly justify your reasoning.

Continue your response to **QUESTION 4** on this page.

- ii. Over a time interval of 2.0 s, the current in the wire is decreased. The initial magnetic flux through the coil is $5.0 \times 10^{-5} \text{ T} \cdot \text{m}^2$ and the final magnetic flux through the coil is $1.0 \times 10^{-5} \text{ T} \cdot \text{m}^2$. The coil has a total resistance of $10 \, \Omega$. Calculate the magnitude of the average current in the coil during the 2.0 s time interval.

The wire is removed and the square coil is positioned so that the coil is directly above and concentric with a round coil of wire connected to a power supply. A part of the square coil is removed and a lightbulb is connected to the coil, as shown above.

- (c) During a short time interval, the current in the power supply is constantly increasing. Use physics principles to explain why the lightbulb is lit during the entire time interval.
