

13.1 Magnetic Flux

Name: _____ Class: _____ Date: _____

Total: 10 marks

Objective

Build the skills to answer exam questions on **magnetic flux**.

You must be able to:

- define **magnetic flux** 磁通量 through a surface as $\Phi_B = \int \vec{B} \cdot d\vec{A}$
- relate flux to the perpendicular component of \vec{B} and the area
- calculate the flux through a flat loop at different orientations
- see how changing the field, area, or angle changes the flux

1 Worked examples

Study these first. Each one shows the method for a question type used later.

■ Magnetic flux

$\Phi_B = \int \vec{B} \cdot d\vec{A}$. For a uniform field through a flat loop this is $\Phi_B = BA \cos \theta$, where θ is the angle between \vec{B} and the loop's normal.

■ When flux is largest

Flux is greatest when the loop **faces** the field ($\theta = 0$) and zero when the field lies **in** the plane of the loop.

■ Central to induction

A **changing** flux is what induces an emf—so flux links magnetic fields to circuits.

2 Practice

2.1 Find the flux through a 0.10 m^2 loop placed face-on in a 0.30 T field. [2]

2.2 State three ways to change the flux through a loop. [2]

2.3 State what a changing magnetic flux produces. [1]

3 Exam-style questions

3.1 Magnetic flux is [1]

- **A** $\int \vec{B} \cdot d\vec{A}$
 - **B** $\int \vec{E} \cdot d\vec{A}$
 - **C** BIL
 - **D** qvB
-

3.2 The flux through a loop is greatest when its plane is [1]

- **A** parallel to the field
 - **B** perpendicular to the field
 - **C** at 45° to the field
 - **D** irrelevant to the field
-

3.3 A 0.050 m^2 coil sits in a 0.40 T field.

(a) Find the flux when the coil faces the field. [2]

(b) Find the flux when the field lies in the plane of the coil. [1]

4 Go further

- work through the **13.1 Magnetic Flux** lesson on the **Learn** page;
- read the **Electromagnetic Induction** section of the AP Physics C: E&M handout on the **Know** page.

Solutions

2.1 $\Phi_B = BA = 0.30 \times 0.10 = 0.030$ Wb.

2.2 change the field strength B , the area A , or the angle θ .

2.3 an induced emf.

3.1 **A.**

3.2 **B** —the plane perpendicular to the field means the loop faces it.

3.3 (a) $\Phi_B = BA = 0.40 \times 0.050 = 0.020$ Wb. (b) zero ($\theta = 90^\circ$).
