

10.4 Dielectrics

Name: _____ Class: _____ Date: _____

Total: 9 marks

KEY WORDS dielectric 电介质 • dielectric constant 介电常数 • polarized 极化
• capacitor 电容器 • capacitance 电容

Objective

Build the skills to answer exam questions on **dielectrics**.

You must be able to:

- describe a **dielectric** 电介质 as an insulator that becomes **polarized** in a field
- explain how the **dielectric constant** 介电常数 κ increases capacitance, $C = \kappa C_0$
- describe how a dielectric reduces the field for a fixed charge
- compare a capacitor with a dielectric at **constant charge** versus **constant voltage**

1 Worked examples

Study these first. Each one shows the method for a question type used later.

■ What a dielectric does

A dielectric is an insulator that **polarizes** in a field; its aligned charges partly cancel the applied field.

■ Effect on capacitance

Inserting a dielectric raises the capacitance to $C = \kappa C_0$ ($\kappa > 1$).

■ Constant charge vs constant voltage

- Isolated (constant Q):** the field and voltage **drop**, so $U = \frac{1}{2}Q^2/C$ falls.
- Connected to a battery (constant V):** more charge flows on, so Q and $U = \frac{1}{2}CV^2$ rise.

2 Practice

2.1 State what happens to a dielectric placed in an electric field. [1]

2.2 A capacitor $C_0 = 2.0 \mu\text{F}$ has a dielectric of $\kappa = 3.0$ inserted. Find the new capacitance. [2]

2.3 State what a dielectric does to the field between the plates at fixed charge. [1]

3 Exam-style questions

3.1 Inserting a dielectric ($\kappa > 1$) makes the capacitance [1]

- | | |
|---|---|
| A | B |
| C | D |
- A smaller
B larger
C zero
D unchanged

3.2 A dielectric is an [1]

- | | |
|---|---|
| A | B |
| C | D |
- A conductor
B insulator that polarizes
C source of charge
D magnet

3.3 A $4.0 \mu\text{F}$ capacitor is charged to 50 V, then **disconnected**; a dielectric of $\kappa = 2.0$ is inserted.

(a) Find the new capacitance. [1]

(b) State what happens to the voltage, and why. [2]
