

5.1 Introducing Statistics: Why Is My Sample Not Like Yours?

Name: _____ Class: _____ Date: _____

Total: 9 marks

KEY WORDS statistic 统计量 • parameter 参数 • sampling variability 抽样变异性

Objective

Build the skills to answer exam questions on **why samples differ**.

You must be able to:

- describe **sampling variability** 抽样变异性
- distinguish a **statistic** 统计量 (describes a sample) from a **parameter** 参数 (describes a population)
- explain why different samples give different statistics

1 Worked examples

Study these first. Each one shows the method for a question type used later.

■ Sampling variability

Different random samples from the same population give **different** values of a statistic — this is **sampling variability**.

■ Statistic vs parameter

- A **statistic** (like $\bar{x}$ or $\hat{p}$) is computed from a **sample** and varies.
- A **parameter** (like μ or p) is a fixed number describing the whole **population**.

2 Practice

2.1 Define sampling variability.

[1]

2.2 State the difference between a statistic and a parameter.

[2]

2.3 State why two random samples give different means. [1]

3 Exam-style questions

3.1 A number describing a sample is a [1]

A	B
C	D

A parameter

B statistic

C population

D census

3.2 A number describing a population is a [1]

A	B
C	D

A statistic

B parameter

C sample

D residual

3.3 Two students each survey 50 people and get different sample proportions.

(a) Name the reason for the difference. [1]

(b) Name the value computed from each sample. [1]

(c) Name the fixed population value. [1]
