KEY WORDS modulus • case split • strict inequality

Inequalities with the modulus sign

Objective

Solve inequalities involving moduli by case splitting from the definition, by squaring both sides, and under a modulus-valued denominator, reporting dead branches and reusing an earlier result when the question says “hence” (FP2 1.1).

1 Key knowledge and worked examples

Two safe moves. Case split from $|f| = f$ where $f \geq 0$ and $-f$ where $f < 0$, intersecting each branch with its own condition; and square $|A| > |B|$ to $A^2 > B^2$ (valid for strict and weak inequalities because both sides are non-negative). Never multiply or divide by an expression of unfixed sign – case-split on its sign instead.

Worked example – one branch dies. Solve $|x^2 - 1| > 2(x + 1)$. Where $x^2 \geq 1$: $x^2 - 2x - 3 > 0$, so $x < -1$ or $x > 3$ (keep only $x \leq -1$ or $x \geq 1$). Where $x^2 < 1$: $1 - x^2 > 2x + 2$ becomes $(x + 1)^2 < 0$ – impossible. Solution: $x < -1$ or $x > 3$. Report the dead branch: it is part of the argument.

Worked example – modulus inside a denominator (WFM02 June 2025 Q8).
With $y = \frac{15x}{|x| + 4}$ and line $y = x - 2$: solve $x - 2 > \frac{15x}{|x| + 4}$. The denominator is always positive, so multiply through. For $x \geq 0$: $x^2 - 13x - 8 > 0$ gives $x > \frac{13 + \sqrt{201}}{2}$. For $x < 0$: $(x + 1)(x + 8) < 0$ gives $-8 < x < -1$. Then “hence” solve $|x - 2| > \left| \frac{15x}{|x| + 4} \right|$: squaring gives the union of part (a) with $(x - 2)(|x| + 4) < -15x$, whose branches are $0 \leq x < \frac{\sqrt{321} - 17}{2}$ and all $x < 0$.

2 Practice

2.1 Solve $|x - 3| < 5$. [2]

2.2 Solve $|2x + 1| \geq 7$. [2]

2.3 Solve $|x - 1| > 2x$. [3]

2.4 Solve $|x^2 - 4| \leq 3x$. [4]

3 Exam-style questions

3.1 (*Original.*) Use algebra to solve $|x + 2| > |2x - 1|$. [4]
