

Exercise walk-through

6.3

Legal Issues

GAC Academic English

Method — Key knowledge: a source describing a problem does not prove your preferred solution

A **warrant** explains why evidence supports a conclusion. State it clearly rather than moving from a problem straight to an untested solution. A **criterion** identifies what the decision should achieve or protect. A fair **counterargument** engages the real objection. An access concern about email is not hatred of every rule. These invented institutional procedures provide argument practice, not actual law or legal advice.

Method — Source A: text or task brief

Original fictional makerspace card L, Log, §1: Across four weeks, forty bookings were recorded. Six slots were unused and four arrivals involved another person already using the equipment. Reasons for unused slots are incomplete. The record does not show whether unused slots and conflicts share cases.

Card P, Proposal, §1: “Ask users to confirm bookings the day before use so unneeded slots can be released.” No confirmation trial has occurred.

Card S, Student concern, §1: “Some users do not check email daily. An email-only confirmation route might exclude them.” No count of affected users or alternative-route performance is supplied.

Local writing task: evaluate a limited confirmation trial using reducing conflicts, preserving access and manageable effort as proposed criteria. Attribute cards by label and section.

Method — Source B: response or review record

Argument draft: “Ten different users lost access, and confirmations will eliminate every problem. Anyone objecting to email-only confirmation hates all rules. An alternative channel has already solved the access concern for free.”

Review request: connect the log to a bounded conclusion through a warrant, then answer the strongest access objection without inventing a successful trial or a cost estimate.

Method — Worked example: make the link and the remaining condition explicit

Known: six unused slots suggest checking whether booked time is still needed; they do not establish why slots were unused or whether email-only confirmation is accessible.

Why state a warrant? It makes the proposed release-of-unneeded-time reasoning visible.

Four conflicts may require another explanation or intervention. The records do not establish ten distinct affected users, since overlap and user identities are unknown. An accessible alternative could be investigated, not described as free or proven.

Exercises 2.1-2.3

2.1 Give the total bookings and unused-slot count. [2]

2.2 Give the conflict count and whether a confirmation trial has occurred. [2]

2.3 Correct THREE claims in the argument draft. [3]

Exercises 2.1-2.3

2.1 Give the total bookings and unused-slot count. [2]

2.1

Forty bookings; six unused slots.

2.2 Give the conflict count and whether a confirmation trial has occurred. [2]

2.2

Four conflicting arrivals; no confirmation trial has occurred.

2.3 Correct THREE claims in the argument draft. [3]

2.3

Any three, B1 each: ten distinct users not established; all-problem elimination untested; email-access objection does not mean hatred of rules; no proven alternative performance; no zero-cost evidence.

Exercises 2.4·3.1

2.4 State a warrant for testing confirmation, one fair objection and one missing measure.[3]

3.1 Develop a conditional recommendation, respond to the access objection and specify two evaluation criteria. Explain how the evidence bears on each. [6]

Exercises 2.4·3.1

2.4 State a warrant for testing confirmation, one fair objection and one missing measure.[3]

2.4

Checking need may allow release of unneeded slots; email-only access may exclude some users; affected-user demand, effort/cost, overlap, reasons or trial outcomes unknown.

3.1 Develop a conditional recommendation, respond to the access objection and specify two evaluation criteria. Explain how the evidence bears on each. [6]

3.1

Limited trial/investigation rather than universal guarantee; alternative accessible route proposed, not proven; conflict/unused-time criterion linked to L's bounded problems; access/effort criterion linked to S/P and missing performance or resource evidence.

Exercise 3.2

3.2 Write a 160–190 word argument using L, P and S, with an explicit warrant, fair objection, conditions and a proportionate conclusion. [8]

Exercise 3.2

3.2 Write a 160–190 word argument using L, P and S, with an explicit warrant, fair objection, conditions and a proportionate conclusion. [8]

3.2

Local analytic rubric, $8 \times B1$: accurate forty/six/four log with L attribution; no invented distinct-user total or universal cure; explicit release-of-unneeded-time warrant with P credit; fair email-access objection with S credit; conditional accessible trial rather than proven/free solution; relevant conflict/access/effort evaluation criteria; proportionate conclusion preserving missing causes and results; coherent truthful 160–190 word response. Example: “The makerspace log supports investigating booking confirmation, but not claiming that it will eliminate every problem. Six of forty bookings were unused and four arrivals involved equipment conflicts during four weeks (L, §1). These counts do not establish ten different affected users because overlap and identity are not recorded.

The proposed warrant is that checking whether a booking is still needed could allow unneeded time to be released (P, §1). This is a reason to test the proposal, not a measured

Full solution 3.2

3.2

Local analytic rubric, $8 \times B1$: accurate forty/six/four log with L attribution; no invented distinct-user total or universal cure; explicit release-of-unneeded-time warrant with P credit; fair email-access objection with S credit; conditional accessible trial rather than proven/free solution; relevant conflict/access/effort evaluation criteria; proportionate conclusion preserving missing causes and results; coherent truthful 160–190 word response. Example: “The makerspace log supports investigating booking confirmation, but not claiming that it will eliminate every problem. Six of forty bookings were unused and four arrivals involved equipment conflicts during four weeks (L, §1). These counts do not establish ten different affected users because overlap and identity are not recorded.

The proposed warrant is that checking whether a booking is still needed could allow unneeded time to be released (P, §1). This is a reason to test the proposal, not a measured outcome. Some conflicts may have other causes, and reasons for unused slots remain incomplete. A fair objection is that email-only confirmation may exclude users who do not check email daily (S, §1); it is not an objection to every rule.

A limited trial could investigate confirmation with another accessible response route, subject to approval and feasible staffing. It should measure unused time and conflicts alongside access difficulties and effort. No alternative has yet been shown effective or free. A decision to expand should therefore depend on reviewed results against stated criteria, rather than an invented guarantee.”
