

GAC027 Identity, Research Initiative and Academic Communication

GAC Social Science

Identity has several connected settings

A student belongs to a family, a school club and a nation, and works with an international project group. Does one label explain every choice the student makes? This supplement develops the public GAC027 outcomes on identity in community, nation and world, analytical research and academic communication. Read it alongside the existing handout, and follow the current centre brief for required tasks and assessment depth.

Personal, community and national identity

Personal identity 个人身份 includes distinctive experiences, commitments and a sense of self. **Community identity** 社区身份 involves belonging and recognition within a community. A community might be connected by place, an activity or shared practices; its members need not agree on everything. **National identity** 国家认同 concerns identification with a nation and its shared histories, symbols or practices. It is not identical to a citizenship document, nor does it make every member think or behave alike.

These identities can overlap. A student may learn a family language, represent a school club and identify with a nation while collaborating with people abroad. The meaning and importance of each connection can change with situation and experience. A role describes expectations in a setting; it does not exhaust a person's identity. Ask what the person reports and does rather than deriving an attitude from a category.

A **global context** 全球背景 concerns relationships across places, such as movement of people, communication, trade or shared problems. A nation's relationship with the world can affect opportunities and experiences without producing one identical national response. Compare the particular interaction, its participants and its evidence. Avoid presenting an individual's account as the opinion of an entire nation.

Worked example: belonging and different expectations

In a fictional international school project, a student wants to include a local example important to their community. The group has limited presentation time and a shared question. A useful discussion asks how the example answers that question, how to explain it to the audience and what the student wants listeners to understand. It does

not assume that everyone from the same nation wants the same example. The group can agree an explicit selection rule and acknowledge differing priorities.

Turn a research question into an achievable project

A **societal research project** 社会研究项目 connects a question with permitted evidence about social life. Choose a question narrow enough for the available time and access. “How do volunteering club members describe barriers to posting in this week’s forum?” is a study of accounts from those volunteers. It cannot promise an explanation of every student’s participation.

Compare **primary research** 一手研究 and **secondary research** 二手研究 before selecting them. Your own voluntary interviews can explore participants’ experiences, but recruitment, wording and small numbers limit reach. Existing records or published studies may cover a wider period, but their definitions, population and purpose may differ. A method is useful when it fits your question, not just because it is new or has a large sample.

Write a short proposal with the question, the people and period, evidence needed, selection, permissions, recording method and intended analysis. Use clear neutral wording. Pilot a question with permission to check understanding, recording the change rather than silently mixing different versions. Do not collect unnecessary identifying or sensitive details. Explain participation and any withdrawal limits under the approved procedure, and respect refusal.

Initiative 主动性 means justifying a useful decision within the permitted task: locating an original source, identifying a missing denominator or proposing a feasible method. Keep a decision log of the problem, options, choice and reasons. Required permissions still apply; do not change recruitment or contact people without them.

Analyse records and alternative explanations

Use **operationalisation** 操作化 to define what a record counts. In the original fictional forum case, participation means at least one post within seven days. Twelve of twenty-four invited members posted, so the recorded posting rate is fifty percent. This is not every form of contribution. A useful project explains what the measure includes and excludes.

Seven nonposters reported device problems, three reported limited time and two gave no reason. These are reported explanations, not independently established causes. The absence of a reason is missing information, not evidence of disinterest. Keep a motivation-focused account and an access-focused account open to checking. A planned paper-response route could investigate additional forms of participation, but

it changes the definition and period. Do not combine its later count with the first week as if the measures were identical.

A **source comparison** 来源比较 checks expertise, method, definitions, selection, period and interests. A forum-only rate differs from one including paper responses. Find compatible definitions before claiming a trend; otherwise report the limit. Interested funding deserves examination, not automatic rejection.

Communicate an argument in academic form

An **academic argument** 学术论证 states a claim, gives relevant evidence, explains its connection and acknowledges limits. Distinguish observation, participant report, interpretation and proposal. “Seven nonposters reported device problems” is more accurate than “Devices caused all nonparticipation.” Support an opinion without presenting it as a measured fact.

Worked example: revise an overclaim

Overclaim: “Half the members do not care, so the new platform will make everyone participate.”

Supported paragraph: “Twelve of twenty-four invited members posted during one week. Several nonposters reported access or time difficulties; interest and offline contributions were not measured. A permitted paper-response option could explore additional participation, with a separate definition and period. These data do not establish that a platform change will make everyone contribute.”

Follow the required format and make question, method, findings and conclusions traceable. Cite borrowed claims with source details. In a presentation, explain the denominator and limits, and invite questions. Confident delivery cannot repair unsupported reasoning.

Practice and explained answers

1. Why does national membership not determine every individual’s opinion?
2. Give one permitted example of initiative in a research project.
3. What does the forum’s fifty-percent rate measure?
4. What does a nonposter giving no reason establish?
5. Why must later paper responses have a separate definition and period?
6. Rewrite “Device problems caused all absence” to fit the recorded case.

Answers. **1.** Experiences and overlapping identities differ between individuals. **2.** Locate a relevant original source or identify a missing denominator. **3.** At least one

forum post in the recorded seven days. **4.** No reason was recorded; disinterest was not established. **5.** Both measure and observation period changed. **6.** Seven nonposters reported device problems; other causes remain untested.
