

6.1 Measurement, methods, statistics and history: evidence and transfer

Name: _____ Class: _____ Date: _____

Total: 8 marks

KEY WORDS reliability • validity

Objective

Distinguish reliability, validity and operational definitions; Analyse experiments, sampling, ethics and statistical inference; Recognise foundational schools and their explanatory commitments. Original practice and authored marking guidance.

1 Key knowledge and worked examples

reliability : Consistency of measurement. **validity** : Evidence for an intended measurement interpretation.

Define a construct, state its observable measure, then ask whether the measure supports the intended interpretation. Random sampling concerns who enters a study; random assignment concerns which condition participants receive. A causal conclusion needs a credible comparison as well as measurement and ethical safeguards. Historical schools differ in the questions and methods they prioritize. See MM.1, MM.2 and HT.1 before using statistical or historical labels as explanations.

Location and spread: a limited analogy

Worked case. Volunteers are randomly assigned to two memory tasks. Does this

make the sample representative of all adults?

No. Assignment improves comparability of conditions within the recruited sample; it does not undo volunteer selection. Generalization requires attention to recruitment, eligibility and population differences. Describe random sampling and assignment separately.

2 Practice

2.1 A stable wrong measurement shows: [1]

A. reliability without demonstrated validity B. perfect validity C. no consistency

2.2 Random assignment primarily supports: [1]

A. causal group comparison B. representative population sampling C. automatic external validity

2.3 Revisit the worked case. State one conclusion its evidence supports and one stronger conclusion it does not support. Explain the difference. [2]

3 Exam-style questions

3.1 A report finds $p=.03$ and concludes that its theory has a 97% probability of being true and a large effect. Correct both inferences. Give the interpretation, supporting reasoning, a relevant alternative or limitation, and an appropriate check. [4]
