2.2 Elasticities of demand and supply

Name: _____ Class: _____ Date: _____ **Total: 16 marks**

KEY WORDS price elasticity of demand
- income elasticity of demand
- price elasticity of supply
- total revenue
- inferior good
- primary commodity

Objective

Build the skills to answer exam questions on **price elasticity of demand** (PED), **income elasticity of demand** (YED) and **price elasticity of supply** (PES), their determinants and their uses.

You must be able to:

- explain PED, YED and PES and their determinants
- explain the link between PED and total revenue
- explain why primary commodities have low PED and PES
- apply elasticities to firms and governments

1 Key knowledge and worked examples

Elasticities

Elasticity measures how much one variable responds to a change in another.

measure	formula	key values
PED	$\frac{\%\Delta Q_d}{\%\Delta P}$	elastic: $\lvert\text{PED}\rvert > 1$; inelastic: < 1; unit elastic: $= 1$
YED	$\frac{\%\Delta Q_d}{\%\Delta Y}$	normal good: > 0 (necessity 0–1, luxury > 1); inferior good: < 0
PES	$\frac{\%\Delta Q_s}{\%\Delta P}$	elastic: > 1; inelastic: < 1

Determinants of PED: number and closeness of **substitutes**; whether a **necessity** or luxury; **proportion of income** spent on it; **time** to adjust; whether it is **addictive** or habit-forming.

PED and total revenue ($TR = P \times Q$): if demand is **inelastic**, a price rise **raises** TR; if **elastic**, a price rise **lowers** TR. Along a straight-line demand curve, PED changes: elastic at high prices, inelastic at low prices.

Determinants of PES: time (supply is more elastic in the long run), **spare capacity**, **stocks**, **mobility of factors**, how fast costs rise.

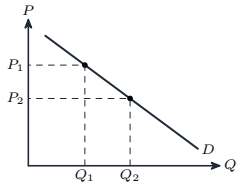

Primary commodities (food, metals) have **low PED** (few substitutes, necessities) and **low PES** (crops take time to grow), so supply or demand shocks cause **large price swings**. Manufactured goods usually have higher PED and PES.

Uses: firms set prices (raise prices on inelastic goods); governments tax inelastic goods (cigarettes, fuel) to raise revenue; YED shows which sectors grow as incomes rise (services, luxury goods) and which shrink (inferior goods), so it guides firms and explains **sectoral change**.

Answer shapes: state the elasticity, say elastic or inelastic, then link to revenue, tax or price changes.

2 Practice

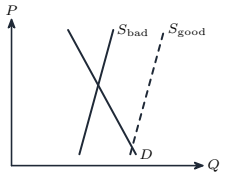

2.1 Define **price elasticity of demand**. [2]

2.2 Explain **two** reasons why demand for petrol is price inelastic. [2]

2.3 Explain why the prices of agricultural products tend to change a lot from year to year. [4]

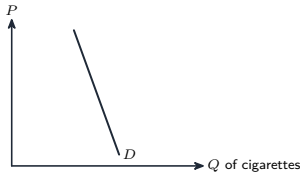

[[drawlines:4]]

3 Exam-style questions

3.1 A government wants to raise tax revenue and reduce smoking.

(a) Explain why cigarettes have a low PED. [2]

(b) Discuss whether taxing cigarettes will meet **both** of the government's aims. [6]
