4.5 Economics of inequality and poverty

Name: _____ Class: _____ Date: _____ **Total: 16 marks**

KEY WORDS Lorenz curve • Gini coefficient • absolute poverty • relative poverty • progressive tax • transfer payment

Objective

Build the skills to answer exam questions on **inequality** and **poverty** : how they are measured, their causes and consequences, and policies to reduce them.

You must be able to:

- distinguish equality and equity, and income and wealth inequality
- use the Lorenz curve and Gini coefficient to describe inequality
- distinguish absolute and relative poverty, and outline multidimensional measures
- explain the causes and consequences of inequality and poverty
- evaluate taxes, transfer payments and other policies to reduce inequality

1 Key knowledge and worked examples

■ Inequality and poverty

Equality means everyone has the same; **equity** means fairness. **Income** is a flow (per year); **wealth** is a stock of assets (houses, shares, savings). Wealth is usually far more unequal than income.

Lorenz curve: plots the cumulative % of households (poorest first) against the cumulative % of income. The **line of perfect equality** is the diagonal; the further the curve bows below it, the more unequal. The **Gini coefficient** $= \frac{\text{area between the line of equality and the Lorenz curve}}{\text{total area under the line of equality}}$, from 0 (perfect equality) to 1 (one household has everything).

Poverty: absolute poverty is income below what is needed for basic needs (the World Bank's international poverty line, about \$3 a day at PPP); **relative** poverty is income well below the typical income in the country (e.g. below 50–60% of median income). The **Multidimensional Poverty Index** (MPI) combines health, education and living standards.

Causes: differences in education and skills, discrimination, unequal ownership of capital and land, inheritance, technology and globalization rewarding high skills, weak social protection, regressive taxes.

Consequences: lower well-being and health, less social mobility, less investment in children's education, crime and social tension, and possibly slower growth.

policy	how it helps	drawback
progressive income tax (higher marginal rates on higher incomes)	rich pay a larger share	may reduce incentives; avoidance
wealth and inheritance taxes	reduce wealth inequality	hard to value; capital flight
transfer payments (pensions, child and unemployment benefits)	raise low incomes directly	cost; poverty trap if benefits fall fast as earnings rise
minimum wage	raises pay of low-paid workers	possible job losses if set too high
education, health and infrastructure	raise future earnings	slow; high cost
universal basic income	a regular payment to all	very high cost

Taxes: direct taxes on income and wealth; **indirect** taxes on spending. A **progressive** tax takes a larger share of higher incomes; a **regressive** tax takes a larger share of lower incomes (most indirect taxes); a **proportional** tax takes the same share.

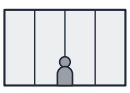

Answer shapes: define the measure → read the data → explain the cause → evaluate the policy (equity vs efficiency).

2 Practice

2.1 Distinguish between absolute poverty and relative poverty. [2]

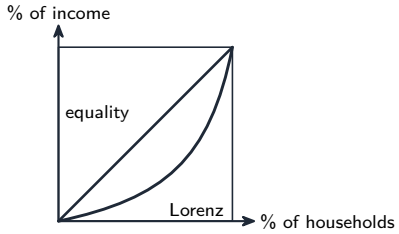

absolute

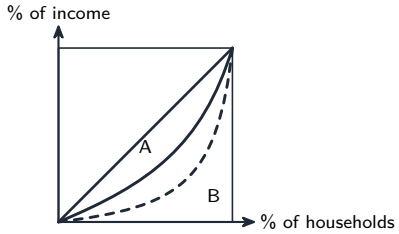

relative

exercises.lol exercises.com.cn

2.2 State what a Gini coefficient of 0 and of 1 would show. [2]

2.3 Explain **two** reasons why the Lorenz curve of a country might move further from the line of equality. [4]

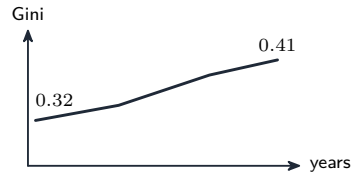

3 Exam-style questions

3.1 A country's Gini coefficient has risen from 0.32 to 0.41 in 20 years.

(a) Describe what has happened to income distribution. [2]

(b) Evaluate the use of transfer payments to reduce income inequality. [6]
