

Transport in Plants

IGCSE Biology ■ Topic 8

IGCSE Biology

What we will cover

- 1 Xylem & phloem
- 2 Water uptake & pathway
- 3 Transpiration
- 4 How water rises
- 5 Translocation

Xylem and phloem

xylem

dead, hollow cells;
thick **lignin** walls

carries water +
minerals **up** only

also **supports**
the plant

phloem

living cells;
sieve plates

carries sucrose +
amino acids

moves **both ways**

Xylem and phloem run through stems

Water uptake and pathway

*Transport
systems move water and sugars*

Transpiration

Transpiration 蒸腾作用 is water loss from leaves:

- water **evaporates** 蒸发 from the mesophyll
- vapour **diffuses** 扩散 out of the **stomata** 气孔

Faster when hotter, windier or drier.

How water rises

transpiration pull 蒸騰拉力

water leaving the leaf
pulls more up behind it

one water column

molecules stick together; losing
water too fast → **wilting** 萎蔫

Translocation

Translocation 转运 moves sucrose in the phloem from a **source** 源 to a **sink** 库.

- source – makes/stores sugar (leaves)
- sink – uses/stores it (roots)

The direction can change.

Worked example – what changes transpiration?

A potometer bubble moves faster when a fan is switched on. Explain why.

- Transpiration is water **evaporating** from the leaves and diffusing out of the stomata.
- Still air lets water vapour **build up** just outside the leaf.
- The fan blows that vapour away, keeping the **concentration gradient steep**.
- Faster diffusion out $\Rightarrow$ faster water uptake $\Rightarrow$ **the bubble moves faster**.

Wind, heat and dry air all **speed up** transpiration; high humidity slows it. Each works by changing the **water-vapour gradient** outside the leaf.

Topic 8 – key takeaways

1

Xylem

water & minerals up; dead, lignified

2

Phloem

sucrose to sources & sinks; living

3

Transpiration

evaporate then diffuse out of stomata

4

Pull

transpiration pull draws up a water column

Check yourself

- 1 Which tissue carries water up the plant?
- 2 Where does water evaporate in a leaf?
- 3 What drives water up the xylem?
- 4 What does translocation move?

Answers 1. xylem 2. the mesophyll cells 3. the transpiration pull 4. sucrose & amino acids
