

39 Why is pectinase useful in fruit juice production?

- A Cloudier juice is produced.
- B More juice can be extracted from the fruits.
- C Proteins in the fruit are digested.
- D Starch is digested to produce more sugar.

40 The diagrams show the stages in the production of human insulin.

Which stage uses the enzyme DNA ligase?

The gene for insulin is identified and removed from a human cell.

A plasmid is removed from a bacterium and cut open.

The gene for insulin is inserted into the plasmid.

The plasmid is inserted into a bacterium that reproduces, and insulin is produced.

40 Human insulin can be produced in large quantities by genetically modified bacteria.

Four of the steps in the processes of genetic modification and insulin production are listed.

- 1 Insulin is removed from the bacterial culture.
- 2 An enzyme is used to cut out the insulin gene from a human chromosome.
- 3 The insulin gene is placed into the plasmid of a bacterium.
- 4 Bacteria with the insulin gene reproduce very rapidly.

What is the order of these steps?

- A 1 → 2 → 3 → 4
- B 2 → 3 → 4 → 1
- C 3 → 2 → 4 → 1
- D 4 → 1 → 2 → 3

40 Some of the processes involved in the production of insulin by genetic modification are listed.

- 1 cutting of bacterial plasmid DNA with restriction enzymes
- 2 expression in bacteria of the human gene to make insulin
- 3 insertion of recombinant plasmids into bacteria
- 4 multiplication of bacteria containing recombinant plasmids

In which order do these processes occur?

- A 1 → 3 → 4 → 2
- B 2 → 1 → 3 → 4
- C 3 → 1 → 2 → 4
- D 4 → 1 → 3 → 2

40 Which features make bacteria useful in biotechnology?

- 1 They are unaffected by antibiotics.
- 2 They do **not** contain plasmids.
- 3 They make complex molecules.
- 4 They reproduce rapidly.

- A 1 and 2
- B 1 and 4
- C 2 and 3
- D 3 and 4

40 The diagram shows a bacterial cell.

Which cell structure makes bacteria useful in genetic modification?
