

- 1 Hot concentrated hydrochloric acid reacts with solid manganese(IV) oxide to make chlorine gas. Chlorine gas is toxic and more dense than air. Concentrated hydrochloric acid is corrosive.

Fig. 1.1 shows the apparatus used to make and collect a sample of chlorine gas.

There is **one** error in the way the apparatus has been set up in Fig. 1.1.

Fig. 1.1

- (a) Name the item of apparatus labelled **X** in Fig. 1.1.
..... [1]
- (b) Identify the substance labelled **Y** in Fig. 1.1.
..... [1]
- (c) Name an item of apparatus that can be used to heat **X** in Fig. 1.1.
..... [1]
- (d) There is **one** error in the way the apparatus has been set up.
Describe a change that needs to be made to the apparatus in Fig. 1.1 to correct this error.
..... [1]
- (e) Explain why this experiment should be carried out in a fume cupboard.
..... [1]

- 1 Eggshells are made from a mixture of calcium carbonate and other insoluble substances.

Calcium carbonate reacts with dilute hydrochloric acid. The equation for the reaction is shown.

The other substances in eggshells do **not** react with dilute hydrochloric acid.

A student finds the percentage by mass of calcium carbonate in an eggshell.

Fig. 1.1 shows the first three steps of the method the student uses.

step 1

Grind the eggshell into small pieces.

step 2

Find the mass of the small pieces of eggshell.

step 3

Add the small pieces of eggshell to excess dilute hydrochloric acid and warm the mixture while stirring it with a glass rod.

Fig. 1.1

- (a) (i) Describe what is seen when the calcium carbonate in the eggshell reacts with dilute hydrochloric acid.
..... [1]
- (ii) Describe what the student should do to make sure the acid is in excess and all of the calcium carbonate has reacted.
..... [2]

(b) After **step 3**, the student filters the mixture to obtain the unreacted solid left from the eggshell.

(i) Draw a labelled diagram of the apparatus the student should use to filter the mixture.

[2]

(ii) After the filtration, the student washes the residue.

Identify the **two** substances removed from the residue by washing.

substance 1

substance 2

[2]

(iii) After washing the residue, the student dries the residue in an oven. The student then measures the mass of the dry residue.

The masses the student records are shown in Table 1.1.

Table 1.1

mass of small pieces of eggshell/g	2.00
mass of dry residue after filtration/g	0.11

Use the data in Table 1.1 to calculate the percentage by mass of calcium carbonate in the eggshell.

percentage of calcium carbonate = [2]

1 A student uses the apparatus in Fig. 1.1 to show that water is formed as one of the products when a fuel is burned. The gases produced when the fuel is burned are passed through the apparatus using a suction pump.

Fig. 1.1

(a) Identify the item of apparatus labelled **W** in Fig. 1.1.

..... [1]

(b) When the fuel is burned, the steam produced passes into the U-tube.

Suggest why the U-tube is surrounded by ice.

..... [1]

(c) Water causes solid **X** in the U-tube to change colour.

Name solid **X** and state the colour change seen.

solid **X**

colour change from to

[2]

The student tries to use the apparatus in Fig. 1.2 to pass the gases produced through acidified aqueous potassium manganate(VII).

There is an error in the apparatus in Fig. 1.2 so that the gases produced will **not** pass through the acidified aqueous potassium manganate(VII).

Fig. 1.2

- (d) Identify the item of apparatus labelled **Y** in Fig. 1.2.

..... [1]

- (e) On Fig. 1.2, draw a circle around the error in the apparatus.

[1]

- (f) The error in the apparatus in Fig. 1.2 is corrected.
The student observes that the acidified aqueous potassium manganate(VII) changes colour from purple to colourless.

Suggest why this colour change occurs.

[Total: 7]

- 1 When heated, magnesium reacts with steam to make magnesium oxide and hydrogen gas.

Fig. 1.1 shows the apparatus a teacher uses to react clean magnesium ribbon with steam and collect the hydrogen gas produced.

Fig. 1.1

- (a) Name the item of apparatus labelled **A** in Fig. 1.1.

..... [1]

- (b) Suggest how the magnesium ribbon should be cleaned before use.

.....

..... [1]

- (c) State the purpose of the mineral wool.

.....

..... [1]

- (d) Draw **two** arrows on Fig. 1.1 to show the **two** places where the apparatus should be heated.

[2]

- (e) During the reaction a colourless liquid collects at the point marked **X** on Fig. 1.1.

Suggest the identity of liquid **X**.

..... [1]

- (f) The gas collected in **A** is **not pure** hydrogen.

Suggest why the gas collected is **not pure**.

.....

..... [1]

[Total: 7]

- 1 Fermentation is a process in which yeast is used to convert aqueous glucose to ethanol and carbon dioxide. Fermentation takes place at a temperature of between 25 °C and 35 °C.

A student uses the apparatus shown in Fig. 1.1 to make carbon dioxide by fermentation.

Fig. 1.1

- (a) Name the items of apparatus labelled **A** and **B** in Fig. 1.1.

A

B [2]

- (b) Suggest why a water-bath is used.

.....

..... [1]

- (c) The student measures the volume of gas that is collected every 10 minutes for 90 minutes.

Their results are shown in Fig. 1.2.

Fig. 1.2

Describe how the results in Fig. 1.2 show that the fermentation is **not** complete after 90 minutes.

..... [1]

- (d) The student repeats the experiment using the apparatus shown in Fig. 1.3.

Fig. 1.3

- (i) State what happens to the appearance of the limewater during fermentation.

..... [1]

- (ii) State **one** observation the student would make that shows that fermentation is complete.

.....

..... [1]

- (e) State the method the student should use to obtain ethanol from the fermentation mixture.

..... [1]
