

1.3 FDP operators, percentage change and compound interest

Name: _____ Class: _____ Date: _____ **Total: 22 marks**

KEY WORDS recurring decimal • compound interest formula

FDP operators, percentage change and compound interest

Objective

Use fractions, decimals and percentages as operators; express one quantity as a fraction/percentage of another; convert recurring decimals; solve percentage-change problems including reverse percentage and the compound interest formula (rows N12–N15 with the Extension additions).

1 Key knowledge and worked examples

Operators. 35% of $240 = 84$; $\frac{3}{5}$ of a quantity multiplies by 3 then divides by 5; 7 as a percentage of 28 is 25% . Recurring decimals (specification original, not sampled): $0.\overline{45} = \frac{45}{99} = \frac{5}{11}$ by shift-and-subtract.

Percentage change. Multipliers: $+12\%$ is $\times 1.12$, -17% is $\times 0.83$. Reverse percentage divides (a £92 price after a 15% increase means £80 originally). Compound interest (specification original, not sampled): $A = P\left(1 + \frac{r}{100}\right)^n$ – £2000 at 3% for 4 years gives $2000 \times 1.03^4 = \text{£}2251.02$.

Original native-lesson illustration; labels belong to its worked example.

2 Practice

2.1 Find 35% of 240 [2]

2.2 Find $\frac{3}{5}$ of 85 [2]

2.3 Express 7 as a percentage of 28 [2]

2.4 Convert $0.\overline{45}$ to a fraction [3]

2.5 Increase 65 by 20% [2]

3 Exam-style questions

3.1 (*Original, specification line not sampled: reverse percentage.*) After a 15% increase a jumper costs £92. Find the original price. [3]

3.2 (*Original, specification line not sampled: compound interest formula.*) £2000 is invested at 3% compound interest. (a) Find the value after 4 years. (b) Find the interest earned. [4]

3.3 (*Original.*) A car worth £12000 depreciates 20% per year. Its value first falls below £2500 during which year? (Use logarithms or trial and improvement.) [4]
