

2.1 Expanding, factorising and algebraic fractions

Name: _____ Class: _____ Date: _____ Total: 25 marks

KEY WORDS quadratic equation

Expanding, factorising and algebraic fractions

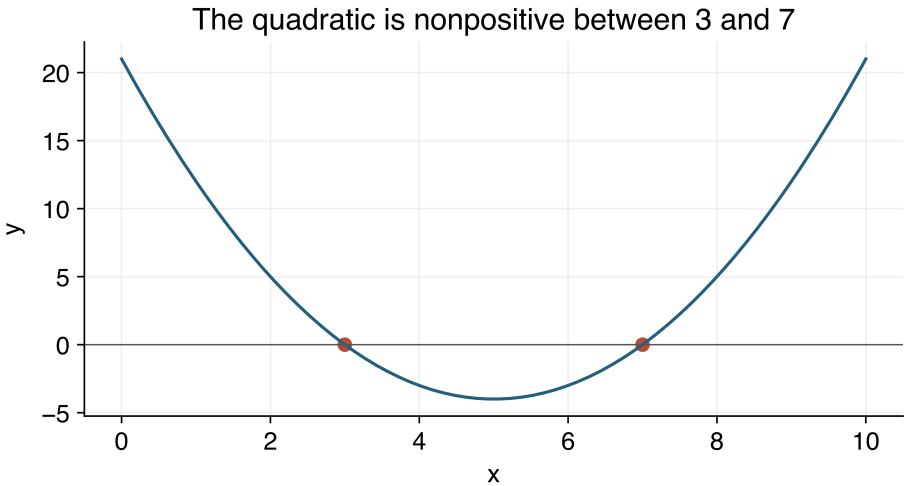

Objective

Expand products of two or three binomials, factorise all quadratics including the difference of two squares, and manipulate quadratic algebraic fractions (rows A4–A7 with the Extension additions).

1 Key knowledge and worked examples

Expanding and factorising. Three binomials: $(x + 2)(x - 3)(x + 1) = (x^2 - x - 6)(x + 1) = x^3 - 7x - 6$. Quadratic factorising: $2x^2 - 7x - 15 = (2x + 3)(x - 5)$; difference of two squares: $9x^2 - 25 = (3x - 5)(3x + 5)$.

Fractions. Factor, cancel whole factors, common denominators; the 2E specimen’s answers $(11m - 14)/(m^2 - 3m - 4)$ and $(2x + 3)/(x + 4)$ come from this machinery. Simplify $\frac{x^2 - 9}{x^2 + 7x + 12} = \frac{(x - 3)(x + 3)}{(x + 3)(x + 4)} = \frac{x - 3}{x + 4}$.

Original native-lesson illustration; labels belong to its worked example.

2 Practice

2.1 Expand and simplify $(x + 2)(x - 3)(x + 1)$ [3]

2.2 Factorise $2x^2 - 7x - 15$ [2]

2.3 Factorise $9x^2 - 25$ [2]

2.4 Simplify $\frac{x^2 - 9}{x^2 + 7x + 12}$ [3]

2.5 Express $\frac{3}{x+1} + \frac{2}{x-2}$ as a single fraction [3]

3 Exam-style questions

3.1 (Original, 2E fraction family.) Simplify fully $\frac{2m^2 - 5m - 3}{m^2 - 3m - 4} \times \frac{m^2 - 2m - 8}{2m^2 + 5m + 2}$ [5]

3.2 (Original.) Make a the subject of $ax + 3 = 5xt - 2a$ (subject twice). [4]

3.3 (Original, specification line not sampled: fractional powers.) Simplify $\frac{8c^5}{3d^3} \div \frac{2c^2}{d}$, giving the answer in index form. [3]
