1. v(t) = 3t² volts. What is the slope dv/dt at t = 2 s, in volts per second?

   _____ V/s

2. What is the modulus of z = 5 − j12?

   _____

3. Solve 2x + y = 7 and x − y = 2. What is x?

   _____

4. dy/dt + 4y = 0 with y(0) = 3. What is y at t = 0.25? Give two decimal places.

   _____

5. Evaluate the Laplace transform of e^(−4t) at s = 1.

   _____

6. At t = T/4, what does the square-wave series (4/π)(1 − 1/3 + 1/5 − …) add up to?

   ☐ 1: the bracket converges to π/4, and (4/π)(π/4) = 1

   ☐ π/4

   ☐ 0.785, and falling

   ☐ Nothing; the series diverges

7. For Gaussian noise with σ = 2 mV, a single reading of 5 mV is impossible.

   ☐ True ☐ False

8. V = 3x²y. What is the electric field E at (1, 2)?

   ☐ (6xy, 3x²)

   ☐ (12, 3) V/m

   ☐ −(6, 3) V/m

   ☐ −(12, 3) V/m

9. A current of +2 mA for 1 s followed by −2 mA for 1 s delivers a net charge of 4 mC.

   ☐ True ☐ False

10. Multiplying a phasor by j rotates it by −90°.

    ☐ True ☐ False

1. **12 V/s**

   $\frac{d}{dt}3t^2 = 6t$, which is 12 at $t = 2$.

2. **13**

   $\sqrt{5^2 + 12^2} = \sqrt{169} = 13$. The minus sign affects the angle, not the length.

3. **3**

   Add the equations to remove y: $3x = 9$, so $x = 3$ and $y = 1$. Check: $2 \cdot 3 + 1 = 7$.

4. **1.1**

   $y = 3e^{-4t}$, so $y(0.25) = 3e^{-1} \approx 1.10$. With no input, only the homogeneous part remains.

5. **0.2**

   $\mathcal{L}\{e^{-4t}\} = \frac{1}{s+4}$, which is $\frac{1}{5} = 0.2$ at $s = 1$.

6. **1: the bracket converges to π/4, and (4/π)(π/4) = 1**

   The alternating series of odd reciprocals sums to $\frac{\pi}{4}$; scaled by $\frac{4}{\pi}$ it gives exactly 1, the value the square wave demands there.

7. **False**

   5 mV is 2.5σ. Readings that far out are rare (about 1%) but they do happen.

8. **−(12, 3) V/m**

   $\nabla V = (6xy, 3x^2) = (12, 3)$ at the point, and $\mathbf{E} = -\nabla V = -(12, 3)$.

9. **False**

   Area below the axis subtracts, so the net charge is $2 - 2 = 0$ mC. 4 mC is the total without signs.

10. **False**

    $j = 1\angle 90°$, so multiplying by j adds $+90°$. Multiplying by $-j$ rotates by $-90°$.
